## 1.0 Executive Summary

The Emission Inventory and Analysis Group (EIAG) at the United States Environmental Protection Agency's (EPA) Office of Air Quality Planning and Standards (OAQPS) triennially produces the National Emission Inventory (NEI). The NEI compiles comprehensive emissions data for criteria pollutants and hazardous air pollutants (HAPs) for mobile, point, and nonpoint sources, including mobile source; aviation, marine vessels, railroads, onroad vehicles and nonroad engines. These data are needed by states, tribal, and local agencies to evaluate emissions trends in each State and to compare emission trends between geographic areas. The NEI is also used as a basis for various EPA air quality modeling and regulatory analyses. The NEI uses the Emission Inventory System (EIS) to aid in the collection and distribution of inventory information. EPA uses the data in the NEI as a starting point to prepare National Emissions Modeling Platforms that are used to prepare emissions inputs that support air quality modeling studies. These studies support both regulatory and non-regulatory analyses and often require data to be created that represent years other than NEI years, including future years.

Eastern Research Group (ERG) developed the 2017 aviation component of the NEI for criteria and hazardous air pollutants (HAPs). The NEI will be used to support modeling activities, help with regulatory initiatives, state implementation programs to address concerns in nonattainment areas and address airport-related emission inquiries.

The emissions associated with airport activities are attributed to the following sources with associated source classification codes (SCC):

- Commercial aviation (SCC: 2275020000)
- Air taxis
  - Piston driven (SCC: 2275060011)
  - Turbine driven (SCC: 2275060012)
- General aviation
  - Piston driven (SCC: 2275050011)
  - Turbine driven (SCC: 2275050012)
- Military (SCC: 2275001000)
- Auxiliary Power Units (SCC: 2275070000)
- Ground Support Equipment
  - Diesel-fueled (SCC: 2270008005)
  - Gasoline-fueled (SCC: 2265008005).

To estimate emissions from these sources, 2017 activity data provided by states were compiled and supplemented with publicly available 2017 and 2014 activity data as described in Section 3. Two approaches were used to estimate emissions from the compiled activity data. For activity that included aircraft-specific data, ERG used the Federal Aviation Administration's (FAA) Aviation Environmental Design Tool (AEDT) to estimate emissions. If such detailed data were not available or AEDT did not import specific activity data or calculate emissions, ERG applied

a more general approach by different aircraft types (i.e., air taxis, general aviation, and military aircraft) using the EPA's available generic emission estimating procedures for the NEI. Additional information on the methodology used is included Section 4 of this document.

Table 1-1 shows that aircraft activity in aggregate was slightly less (2%) in 2017 than in 2014. Commercial air carriers accounted for a 10% decline in activity while general aviation and air taxis equipped with piston engines representing a 4% decline and general aviation and air taxis equipped with turbine engines representing a 5.8% increase.

**Table 1-1. 2014 and 2017 LTO Comparison**

| SCC        | SCC Description                     | 2014 LTO   | 2017 LTO*  | Percent Difference |
|------------|-------------------------------------|------------|------------|--------------------|
| 2275001000 | Aircraft/Military                   | 4,171,442  | 4,034,228  | -3%                |
| 2275020000 | Aircraft/Commercial                 | 8,739,662  | 7,822,548  | -10%               |
| 2275050011 | Aircraft /General Aviation /Piston  | 28,659,568 | 27,945,914 | -2%                |
| 2275050012 | Aircraft /General Aviation /Turbine | 11,178,890 | 12,059,215 | 8%                 |
| 2275060011 | Aircraft /Air Taxi /Piston          | 1,503,373  | 992,378    | -34%               |
| 2275060012 | Aircraft /Air Taxi /Turbine         | 4,532,778  | 4,569,582  | 1%                 |
| Total      |                                     | 58,785,712 | 57,423,865 | -2%                |

\* Reminder that 2017 Activity was a combination of 2017 and 2014 data.

Due to expected changes between EDMS and AEDT<sup>1</sup>, the emissions for 2014 and 2017 were predictably different. Because the underlying equations were revised the emission differences were not consistent between airports, aircraft or pollutants. Though CO<sub>2</sub> and PM<sub>2.5</sub> were lower in 2017, CO, PM<sub>10</sub>, NO<sub>x</sub>, SO<sub>x</sub> and VOC were all higher. It should also be noted that due to a rounding issue within the AEDT model, actual emissions may be slightly larger; it is anticipated that this rounding issue will be addressed in the FAA's March 2021 update.

**Table 1-2. Total Annual Emissions from Airports**

| Pollutant Name                          | 2014 Emissions (Ton) | 2017 Emissions (Ton) |
|-----------------------------------------|----------------------|----------------------|
| Carbon Dioxide                          | 69,972,136.20        | 28,012,538.41        |
| Carbon Monoxide                         | 462,547.40           | 498,092.13           |
| Nitrogen Oxides                         | 162,510.69           | 123,415.22           |
| PM <sub>10</sub> Primary (Filt + Cond)  | 11,414.87            | 10,006.17            |
| PM <sub>2.5</sub> Primary (Filt + Cond) | 10,134.30            | 8,764.17             |
| Sulfur Dioxide                          | 18,280.24            | 16,135.45            |
| Volatile Organic Compounds              | 51,874.77            | 59,243.71            |

Summary of criteria and HAP emissions are provided in Section 5. A complete list of references are provided in Section 6.

## **2.0 Introduction**

### **2.1 Purpose and Objectives**

The U.S. EPA issued Work Assignment (WA) 2-19, “Mobile Source Emission Inventory Development for 2017 National Emission Inventory and National Modeling Platforms” under EPA Contract Number EPA-EP-C-17-011, to Eastern Research Group, Inc. (ERG) to support the development of the 2017 aircraft component of the NEI. This report documents procedures used to estimate 2017 aviation emissions and is a deliverable under this work assignment.

To develop the comprehensive inventories for the aircraft source category, ERG conducted the following tasks:

- Compiled aircraft landing and takeoff (LTO) data from several Federal Aviation Administration’s (FAA) data sources including the following:
  - For aircraft specific data: 2017 T-100 dataset, and
  - For generic aircraft data: 2014 Terminal Area Forecast (TAF) data, 2014 Air Traffic Activity Data Systems (ATADS) data, and 2014 Airport Master Record (form 5010) data.
- Compiled state submitted 2017 LTO data.
- Calculated emission estimates using FAA’s AEDT version 2d and generic emission factors.
- Summarized activity and emissions data.

It should be noted that the engine-specific factors used in the AEDT model were derived from testing data used to certify the engines and account for U.S. and international emissions standards at the time of manufacture.

Section 3.0 of this report identifies the national and state activity data sources included in this study. This section describes how ERG pulled from each activity data source to compile the 2017 activity dataset. This section also documents any assumptions or adjustments that were made to each data source to facilitate the development of the activity dataset.

Section 4.0 summarizes the emissions estimation methodology used to develop the 2017 airport inventory, various summary emissions tables for criteria pollutants, lessons learned and suggestions for future projects.

The criteria and HAP emissions associated with airport activities are included in the Access database files submitted with this report for 2017.

### **2.2 Background**

This report covers airport activities as point/facilities sources in the emission calculation and for the EPA’s EIS. The AEDT model treats airports as point/facilities. The aircraft source category

includes all aircraft types used for public, private, and military purposes. The emissions associated with airport activities are attributed to the following sources with associated SCC:

- Commercial aviation (SCC: 2275020000)
- Air taxis
  - Piston driven (SCC: 2275060011)
  - Turbine driven (SCC: 2275060012)
- General aviation
  - Piston driven (SCC: 2275050011)
  - Turbine driven (SCC: 2275050012)
- Military (SCC: 2275001000)
- Auxiliary Power Units (SCC: 2275070000)
- Ground Support Equipment
  - Diesel-fueled (SCC: 2270008005)
  - Gasoline-fueled (SCC: 2265008005).

Commercial air carriers (AC) transport passengers, freight, or both and tend to be larger aircraft that are driven with jet engines. Air taxis (AT), which are also considered to be commercial aircraft, are usually smaller aircraft (less than 60 passengers) that operate on a limited basis compared to larger commercial aircraft that carry between 60 and 800 passengers. General aviation (GA) includes most other aircraft used for recreational flying and personal transportation. Smaller aircraft that support business travel, usually on an unscheduled basis, are also included in the GA category.

Aircraft tend to emit significant amounts of air pollutants. The national AT and GA fleet includes both jet and propeller-driven aircraft. Most of the AT and GA fleet are comprised of piston- (or propeller-) driven aircraft, though these aircraft types also include smaller business jets and turboprops and helicopters equipped with piston or turboshaft engines. The piston-driven aircraft tend to have higher VOC emissions and lower NO<sub>x</sub> emissions than turbine-powered aircraft. For this inventory it is assumed that propeller-driven aircraft and turbine-driven aircraft account for 72.1% and 27.9%, respectively, of all GA emissions.<sup>1</sup> Propeller-driven aircraft and turbine-driven aircraft account for 21.8% and 78.2%, respectively, of all AT emissions.<sup>1</sup> These values were used as a national-scale default value obtained from published studies used to investigate lead emissions from aviation sources.

Military aircraft (MIL) comprise a wide range of aircraft types such as training aircraft, fighter jets, helicopters, and jet- and propeller-driven cargo planes of varying sizes. Because of limited information concerning the make-up of the military aircraft fleet, for this inventory it was assumed that most military aircraft are jet-powered.

Aircraft emissions are associated with an aircraft's landing and takeoff (LTO) cycle. The cycle begins when the aircraft approaches the airport on its descent from cruising altitude, then lands and taxis to the gate, where it idles during passenger deplaning. The cycle continues as the

aircraft idles during passenger boarding, taxis back onto the runway, takes off, and ascends (or climbs out) to cruising altitude. Figure 2-1 illustrates the six specific operating modes in an LTO cycle:

- Approach
- Taxi/idle-in
- Taxi/idle-out
- Idling
- Takeoff
- Climb out.

The LTO cycle provides a basis for calculating aircraft emissions associated with airports. During each mode of operation, an aircraft engine operates at a specific power setting and fuel consumption rate for a given aircraft make and model. Emissions for one complete cycle are calculated by multiplying emission factors for each operating mode for each specific aircraft engine and the typical period of time the aircraft is operating. It should be noted that AEDT estimates aircraft emissions based on a specified flight path. The flight path for this study is based on a single runway that represents the airports activities.

**Figure 2-1. Landing and Takeoff Cycle**

### **3.0 Data Sources for Activity Data**

To implement this project, ERG obtained aircraft activity data from various sources. There are two general sources of airport data; the preferred sources are local data from the states themselves. The other are publicly available national data sources from the FAA. Section 3.1 discusses the national data sources and Section 3.2 discusses the state provided data.

#### **3.1 National Data Sources Airport Activities**

ERG compiled aircraft landing and takeoff (LTO) data from several Federal Aviation Administration's (FAA) data sources including the following: 2017 T-100 dataset, 2014 Terminal Area Forecast (TAF) data, 2014 Air Traffic Activity Data Systems (ATADS) data, and 2014 Airport Master Record (form 5010) data.

The T-100 data is derived from commercial aviation operations, reported directly by the airlines and specifically includes very detailed information about large commercial air carriers and air taxis. Because the T-100 aircraft data are provided for individual aircraft specifying manufacturer and aircraft model, they can be matched to specific aircraft in the FAA's new Aviation Environmental Design Tool (AEDT) which is a SQL based software tool used to estimate emissions. Please note the previous FAA's Emission Dispersion and Modeling Systems (EDMS) emissions will not be accepted anymore for the NEI. Because of the details provided in T-100, it is also possible to identify which aircraft are typically used for air taxi services based on typical passenger capacity. All non-air taxi data in the T-100 data are assumed to be larger commercial aircraft.

The FAA's TAF and ATADS datasets do not provide operations data at the aircraft manufacturer and model level of detail that the T-100 data does; instead, operations are provided for general aircraft types (i.e., AC, AT, GA and MIL). ATADS includes actual operations at FAA controlled facilities, while TAF includes the ATADS data and also modeled operations for other non-FAA control facilities. Note that the TAF and ATADS data are provided as operations (separate operation counts for each landing and takeoff leg), such that the TAF and ATADS operations need to be divided by 2 to get LTOs.

Previously the TAF/ATADS data were adjusted because both the T-100 data and the TAF/ATADS data include AC and AT; these data needed to be adjusted to avoid issues of double counting when the two datasets were combined. However due to resource issues, the EPA is using the TAF/ATADS 2014 data with no adjustments for the 2017 NEI with the assumption the overlap is not significant and cannot be quantified due to the differing years.

The 5010 forms are used for airport infrastructure planning include a variety of information about airport operations and characteristics. Such information is particularly important for smaller facilities where data sources are sparse. The ERG reviewed the data reported in the 5010

submittals to estimate LTO activity for general aviation and air taxis. No additional adjustments were made to the 5010.

The data were compiled into a user friendly database for EPA review. Airports or aircraft engine configurations added since 2011 were clearly identified as they needed to be added to the EPA's Emission Inventory System (EIS).

### 3.2 State Provided Airport Activity Data

The national LTO data were posted for states to review. Instructions that delineate the review process were included with the posted data and are provided in Appendix A. State/local/tribal agencies provided local LTO data as deletions, additions or changes to the national LTO data for their jurisdiction. State/local/tribal agency submitted data were evaluated and if appropriate, were included in the national LTO data file. Table 3-1 lists the state/local/tribal agencies that provided data or comments.

**Table 3-1. Agencies That Provided Activity Data or Commented on Data**

| State | Affiliation                                                        |
|-------|--------------------------------------------------------------------|
| CT    | Connecticut Department of Energy and Environmental Protection      |
| DE    | Delaware Department of Natural Resources and Environmental Control |
| FL    | Florida Department of Environmental Protection                     |
| GA    | Georgia Environmental Protection Division                          |

Appendix B includes the detailed LTO data submitted by states.

The final LTO database with state data incorporated was then compared to the LTO data in the 2014 inventory. Table 3-2 summarizes the LTO comparison.

**Table 3-2. 2014 and 2017 LTO Comparison**

| <b>SCC</b> | <b>SCC Description</b>              | <b>2014 LTO</b> | <b>2017 LTO</b> | <b>Percent Difference</b> |
|------------|-------------------------------------|-----------------|-----------------|---------------------------|
| 2275001000 | Aircraft/Military                   | 4,171,442       | 4,034,228       | -3%                       |
| 2275020000 | Aircraft/Commercial                 | 8,739,662       | 7,822,548       | -10%                      |

## **4.0 Summary of 2017 Emissions Development**

### **4.1 Emission Estimation Methodology**

To develop the most accurate aircraft emission inventory possible, ERG took two different approaches. If aircraft-specific data were available, ERG used the FAA's AEDT model in conjunction with detailed aircraft activity data from T-100. If such detailed data were not available, then ERG applied a more general approach for different aircraft types (i.e., air taxis, general aviation, and military aircraft) using available generic emission estimating procedures. Using these two complementary approaches provides the most accurate emission estimates for the larger commercial jets, which tends to be the most significant aircraft emission source, while still providing estimates for smaller aircraft.

#### **4.1.1 Aircraft Specific Estimation Methodology (AEDT)**

AEDT was used for the aircraft-specific activity data. To pull the data into AEDT, ERG developed a standalone tool to create AEDT Standard Input Files (ASIF) that are directly imported into AEDT. ASIF is the only format AEDT uses for importation.

During the implementation of this project, there were cases where AEDT could not process data from specific airports or aircraft; these included:

- Importing airports not in AEDT
- Data for some airports in AEDT would not import
- Importing helicopter data
- Aircraft (not helicopters) located at heliports that did not have runways

Where airports were identified as having issues with importing activity data, these airports were matched to surrogate airports within AEDT that did not have activity in 2017. The non-imported activity data were applied to these surrogate airports and AEDT was rerun to estimate emissions. When possible, the selected surrogate airports were geographically close to the original airport. The airport codes were then updated to the original codes in the final inventory to ensure the emissions were applied to the correct airport.

Where AEDT would not accept activity data for a specific aircraft, these incidents were identified and the associated LTOs were applied to the generic emission estimation methodology.

After confirming all operations had been successfully imported into AEDT, the model was run and exported into three .csv files, one file for aircraft operations, one file for criteria emissions, and one file for HAP emissions. Due to how the AEDT model is designed, multiple individual files must be exported and combined to build a complete inventory. These files were exported and formatted for the flight path below mixing height, APU operations, and GSE operations. The

emissions were converted from grams to short tons and additional IDs were added to each file, including state facility identifiers, SCC codes, and aircraft engine type codes. The emissions data were exported as emission factors and were then multiplied by the various operations to estimate total emissions by aircraft type and airport.

Through additional testing, it was noted that certain runway combinations did not result in emissions being calculated in AEDT. This was discovered when comparing the aircraft operations output file to the emissions output file. After identifying these airport aircraft engine combinations, ASIF files were created with a different runway combination. The emissions inventory was then run in AEDT and exported into three additional .csv files. The aircraft operations output file was compared to the emissions output file to determine the remaining airport aircraft engine combinations that did not have emissions calculated in AEDT.

Emissions for the remaining airport aircraft engine combinations were developed using the generic emissions methodology detailed in Section 4.1.2. Only 0.6% of the aircraft specific LTOs that were in AEDT required the generic emissions estimation methodology.

#### 4.1.2 Generic Emissions Estimating Procedures

AEDT can provide emission estimates if the aircraft make and model are known. Often this is not the case for air taxis, general aviation, and military aircraft activity in the TAF and 5010 datasets. For smaller airports without aircraft specific activity from the T100, ERG used the generic approach that relies upon representative criteria emission factors and HAP speciation profiles provided by EPA<sup>7,8,9</sup>, using the following equation:

$$E_{ij} = LTO_i \times FR_x \times EF_{ij}$$

Where:

- $E_{ij}$  = Emission estimate for aircraft type i equipped with engine type x and pollutant j (lbs/year)
- $LTO_i$  = Annual count of LTO cycles for aircraft type i
- $FR_x$  = Fraction of LTOs equipped with engine type x
- $EF_{ij}$  = Generic emission factor for aircraft type i equipped with engine type x and pollutant j (lbs/LTO)
- i = Aircraft type (i.e., air taxi, general aviation, and military)
- x = Engine type (i.e., jet or turboprop, and piston engine)
- j = Criteria pollutant j

Critical to the calculation is the application of representative emission factors that account for the different aircraft in the national fleet. Table 4-1 lists all of the criteria pollutant emission factors used for the generic approach. Appendix C lists all of the generic criteria and HAP emission factors by SCC.

As discussed above, when the GA and AT breakout is unknown, EPA assumed that 72.1% of all GA activity are powered by propeller-driven aircraft and 27.9% are jet- (or turbine) driven; and 21.8% of all AT activity are powered by propeller-driven aircraft and 78.2% are jet- (or turbine) driven. The 5010 data had the piston and jet engines already disaggregated.

**Table 4-1. Emission Factors for Aircraft Types (pounds per LTO)**

| Aircraft Type                | Pollutant |                 |                       |                        |                 |       |
|------------------------------|-----------|-----------------|-----------------------|------------------------|-----------------|-------|
|                              | CO        | NO <sub>x</sub> | PM <sub>10</sub> -PRI | PM <sub>2.5</sub> -PRI | SO <sub>x</sub> | VOC   |
| Commercial                   | 22.38     | 18.58           | 1.08                  | 1.05                   | 1.78            | 6.16  |
| Air Taxi (turbine)           | 3.61      | 0.78            | 0.60                  | 0.59                   | 0.16            | 1.01  |
| Air Taxi (propeller)         | 28.13     | 0.16            | 0.60                  | 0.42                   | 0.02            | 0.17  |
| General Aviation (turbine)   | 9.58      | 0.32            | 0.24                  | 0.23                   | 0.07            | 0.69  |
| General Aviation (propeller) | 12.01     | 0.07            | 0.24                  | 0.16                   | 0.01            | 0.15  |
| Military                     | 25.96     | 22.33           | 1.39                  | 1.36                   | 2.11            | 10.87 |

#### 4.1.3 In-Flight Lead Emissions

In-flight emissions are estimated for lead from GA and AT use of aviation gas in piston powered aircraft. The in-flight lead calculation was based on the lead content (2.12 grams/ gal) and total 2017 aviation gas usage (209 million gallons) minus the GA and AT LTO lead emissions (221.06 tons), providing an in-flight lead estimate of 242.8 tons of lead. The calculation used the following equation:

$$IF_{pb} = (FC \times LC \times Rt \times CF) - LTO_{pb}$$

Where:

|                   |   |                                                                                                            |
|-------------------|---|------------------------------------------------------------------------------------------------------------|
| IF <sub>pb</sub>  | = | Inflight lead estimates (tons of lead /year)                                                               |
| FC                | = | 2017 aviation gas fuel consumption (gallons/year)                                                          |
| LC                | = | Lead content of aviation gas (2.12 g lead/gallon of fuel)                                                  |
| Rt                | = | Lead retention rate 95%                                                                                    |
| CF                | = | Conversion factor: g to ton                                                                                |
| LTO <sub>pb</sub> | = | Total lead emissions from GA and AT use of aviation gas associated with LTO activities (tons of lead/year) |

#### 4.1.4 Revisions to Aircraft Specific Estimation

After the preliminary NEI emissions were posted, it was noted that AEDT emissions seems to be unusually high. Because the 2014 emissions were developed using EDMS and the 2017 estimates were derived from AEDT and the differences between the two models are significant, the larger 2017 values were not immediately noticeable. After additional review, it was apparent that emissions from AEDT were doubled due an additional track being incorrectly added in the AEDT input file. To correct for this error, all emissions from AEDT were multiplied by 50%.

## 5.0 Summary of Airport Emissions

Table 5-1 summarizes the total annual emissions from airports; emissions disaggregated by SCCs, are provided in Appendix D. Figure 5-1 summarizes the VOC emissions as a pie chart by SCC descriptions. Table 5-1 and Figure 5-1 have been revised to reflect the corrected emission estimates. It should be noted that AEDT estimates HAP emissions for all phases of operation, except start up, where an appropriate speciation file has yet to be developed.

**Table 5-1. Total Annual Emissions from Airports**

| Pollutant Name                          | Pollutant Code         | Emissions (Ton) |
|-----------------------------------------|------------------------|-----------------|
| Carbon Dioxide                          | CO <sub>2</sub>        | 28,012,538.41   |
| Carbon Monoxide                         | CO                     | 498,092.13      |
| Nitrogen Oxides                         | NO <sub>x</sub>        | 123,415.22      |
| PM <sub>10</sub> Primary (Filt + Cond)  | PM <sub>10</sub> -PRI  | 10,006.17       |
| PM <sub>2.5</sub> Primary (Filt + Cond) | PM <sub>2.5</sub> -PRI | 8,764.17        |
| Sulfur Dioxide                          | SO <sub>2</sub>        | 16,135.45       |
| Volatile Organic Compounds              | VOC                    | 59,243.71       |
| 1,3-Butadiene                           | 106990                 | 927.74          |
| 2,2,4-Trimethylpentane                  | 540841                 | 15.06           |
| 2-Methylnaphthalene                     | 91576                  | 110.03          |
| Acenaphthene                            | 83329                  | 2.62            |
| Acenaphthylene                          | 208968                 | 14.77           |
| Acetaldehyde                            | 75070                  | 2,306.25        |

**Instructions for State Review**

## 2017 Aircraft LTO Data Processing for the National Emission Inventory

---

### **Purpose**

To assist state, local, and tribal agencies in their submittal of aircraft-related activity data, EPA has compiled the aircraft landing and takeoff (LTO) data from several Federal Aviation Administration's (FAA) data sources including the following: 2017 T-100 dataset, 2014 Terminal Area Forecast (TAF) data, 2014 Air Traffic Activity Data Systems (ATADS) data, and 2014 Airport Master Record (form 5010) data. These data are available for review and revision by agencies in order to accurately estimate activity data for all aircraft types. These compiled data, including local revisions, will be used to calculate the 2017 National Emission Inventory (NEI) aviation emissions.

Please note that by reviewing and correcting the LTO data in this dataset you will NOT need to submit an airport emissions file to EIS. If you send the revisions back to EPA now, EPA will perform the processing tasks required, such as matching EIS facility, unit, and process IDs for the airports, as well submitting the emissions inventory to the EIS Gateway. This will be the easiest way for agencies to submit local data into EIS; those who choose not to participate in this data gathering process, but still want local emissions data included in EIS, will be required to prepare their data to meet all EIS input requirements and submit it themselves.

### **Background**

The T-100 data is derived from commercial aviation operations, reported directly by the airlines and specifically includes very detailed information about large commercial air carriers and air taxis. Because the T-100 aircraft data are provided for individual aircraft specifying manufacturer and aircraft model, they can be matched to specific aircraft in the FAA's New Aviation Environmental Design Tool (AEDT) which is SQL based software tool used to estimate emissions. Please note the previous FAA's Emission Dispersion and Modeling Systems (EDMS) emissions will not be accepted by the EPA anymore for the NEI. Because of the details provided in T-100, it is also possible to identify which aircraft are typically used for air taxi services based on typical passenger capacity. All non-air taxi data in the T-100 data are assumed to be larger commercial aircraft.

The FAA's TAF and ATADS datasets do not provide operations data at the aircraft manufacturer and model level of detail that the T-100 data does; instead, operations are provided for general aircraft types (i.e., air carriers, air taxis, general aviation and military). ATADS includes actual operations at FAA controlled facilities, while TAF includes the ATADS data and also modeled operations for other non-FAA control facilities. Note that the TAF and ATADS data are provided as operations (separate operation counts for each landing and takeoff leg), such that the TAF and ATADS operations need to be divided by 2 to get LTOs.

Previously the TAF/ATADS data were adjusted because both the T-100 data and the TAF/ATADS data are reported by the airports include commercial air carriers and air taxis, the data needs to be adjusted to avoid issues of double counting when the two datasets are combined. However due to resources, the 2014 data were used with no adjustments for the 2017 NEI with the assumption the overlap is not significant and cannot be quantified due to the differing years.

The 5010 forms are used for airport infrastructure planning include a variety of information about airport operations and characteristics. Such information is particularly important for smaller facilities where data sources are sparse. ERG reviewed the data reported in the 5010 submittals to estimate LTO activity for general aviation and air taxis. Again no additional adjustments were made to the 5010.

### **Reviewing/Revising Data**

The compiled LTO data are available for state/local/tribal (SLT) agency review. The data are presented as a Microsoft Access database. The database includes two drop-down menus: one for selecting data by state and one for selecting data by tribal code. Once the state/tribe has been selected, users have the option of viewing the data in Access (this is Read Only and for review ONLY) or exporting the data to a Microsoft Excel spreadsheet for further review and revisions. Agencies will need to review both the LTO data as well as facility information. The LTO data will include the Airport identification information, aircraft information, and LTO data. The facility data will include airport identification information, address, coordinates, description, and operating status.

Please note that to export the data to Excel, the user will first need to create a folder on the C drive of their computer called “2017 NEI LTO Review” (C:\2017 NEI LTO Review) The exported Excel file(s) will be generated in this folder. Revisions should be made in the Excel files as described below to facilitate EPA processing and avoid errors:

- **Revising Data:** Existing LTO data can be corrected by adding the new data value to the “Revised LTO” column and marking it as a “Revision” in the “Revisions Comment” field.
- **Removing Data:** Please DO NOT DELETE ANY ROWS in the Excel spreadsheet. If you want to remove LTO data, simply change the “Revised LTO” column to 0 and mark it as a “Revision” in the “Revisions Comment” field.
- **Adding Data:** Rows can be added to account for new aircraft or engine type combination. Please make sure that the airport, aircraft, and engine combination does not already exist in the dataset before adding new rows, as adding an existing combination may cause double counting. When adding a row, fill in all other fields when possible, including the

EISFacilitySiteIdentifier where possible. Also, leave the “PrimaryKey” and the “EPA LTO” fields blank, as these fields are for internal record keeping.

- The EPA will assume a default taxi in time of 7 minutes and a default taxi out time of 19 minutes. If states want to revise the taxi in or out time for specific airports please add the correct times in revised taxi in time and revised taxi out time columns.
- Please note there are some airports in the dataset with limited information pertaining to the airport name, county FIPs, and addresses. Please add additional information if possible.
- There may also be issues with geographic data for airports. In many of the new airports the latitude and longitude are inconsistent with the FIP, city, state, and zip code. Please review and correct these issues if possible.

See Tables A-1, A-2, A-3, and A-4 for examples on how to correctly submit LTO revisions. See Tables A-5, A-6, and A-7 for examples on how to correctly submit airport revisions. Please note that some EIS-required fields (i.e., EISEmissionsUnitIdentifier and EISEmissionsProcessIdentifier) are not included in the database. These fields were removed to simplify the data revision process and will be added by EPA. The EISFacilitySiteIdentifier, which is unique, is included, however, to avoid errors resulting from duplication of the more common three digit alphanumeric airport code, FacilitySiteIdentifier. (Note that the FacilitySiteIdentifier indicated may be one of many alternate ones for a given airport). Some airports in the database currently do not have an EISFacilitySiteIdentifier; EPA will add these during processing. If your airport is not included in this database (either with or without an EISFacilitySiteIdentifier) please add the airport and be prepared to provide the airport’s street address, city, state, zip, and latitude/longitude coordinates in the airport revisions.

The AircraftEngineTypeCodes are available under the Reporting Code Tables link in the EIS gateway.

### **Submitting Data to EPA**

States must submit their changes by DATE to this email address managed by EPA’s contractor Eastern Research Group (ERG): [NEI-2017LTO@ERG.com](mailto:NEI-2017LTO@ERG.com). If no changes are required, you may indicate that you accept EPA’s estimates via an EIS support request (as you would for any category of data for which you accept EPA estimates), or by sending an email indicating acceptance to the above address. Note this email account has a 10 MB limit. If a state submittal is larger than 10 MB, a message can be left at this e-mail address requesting data transfer using a secure FTP site. A representative from ERG will respond to this request with instructions how to access the FTP site.

The EPA will review the state-submitted data to ensure that it is appropriate and reasonable. Once the LTO data have been finalized, then the aircraft specific LTO data will be run using the latest version of AEDT to estimate criteria and HAP emissions for aircraft engine exhaust, auxiliary power units, and ground support equipment. The remaining aircraft type data will be applied to generic emission factors.

If you need assistance, contact Janice Godfrey; 919-541-3391; [godfrey.janice@epa.gov](mailto:godfrey.janice@epa.gov).

**Note EPA strongly encourages agencies to review and, if necessary, submit their LTO data to the EPA via this review process. In doing so, then states need not submit EIS staging tables for the 2017 NEI.**
