

COLUMBIA RIVER BASIN
RESTORATION PROGRAM

Columbia River Basin Restoration Program Working Group

Toxics Monitoring Subgroup Meeting 3
June 2, 2022

Monitoring Subgroup Recommended by CRBRP Working Group

Goal: Advance recommendations from the 2010 Columbia River Toxics Reduction Action Plan and specifically, the June 2021 Monitoring Webinar proposal to develop a committee to guide long-term monitoring.

Objective: Initiate the development of a strategy for coordination of long-term monitoring of toxics and sharing of resulting data at the Columbia River Basin scale.

Agenda

- 1:00 **Welcome, Agenda Review, and Introductions** *Mary Lou Soscia (EPA), Jen Bayer (USGS), and Greg Frey (Council Oak)*
- 1:10 **Topic 1:** Revisit programmatic QAPP idea
Presentation from Donald Brown, EPA Region 10 Regional Quality Assurance Manager
- 2:10 **Topic 2:** Revisit idea of standardized monitoring design
- 2:30 **Topic 3:** What else do you need to successfully coordinate towards a CRB-wide toxics monitoring strategy?
- 2:50 **Next Steps** *Mary Lou Soscia and Greg Frey*

Introduction to Microsoft Teams

The screenshot shows a Microsoft Teams meeting window. On the left is a map of the Columbia River Basin, highlighting Washington, Oregon, and Idaho, with various cities and geographical features labeled. The main area contains the following text:

Welcome to the
Columbia River Basin
Restoration Program Remote
Working Group Meeting!

October 22, 2020

At the bottom is a dark control bar with several icons: a clock showing 12:19, a video camera icon, a microphone icon, a screen share icon, a three-dot menu icon, a hand icon, a chat icon, a people icon, a 'Request control' button, and a red phone icon. To the right of the bar is the United States Environmental Protection Agency (EPA) logo. Below the control bar, there are three red callout boxes with arrows pointing to specific icons:

- A box pointing to the video camera icon: "Click to turn video camera off/on"
- A box pointing to the microphone icon: "Click to turn microphone off/on"
- A box pointing to the chat icon: "Click to open chat function"

In the bottom right corner, there is a circular profile picture placeholder with the letters 'GF' and a name 'Greg Evans' partially visible below it.

Welcome & Introductions

When called on, please introduce yourself and identify who you represent.

Toxics Monitoring Subgroup Goals

1. Providing a forum to exchange toxics monitoring information, discuss challenges, and coordinate monitoring activities to complement existing CRBRP working group meetings.
2. Developing a strategy for coordinated monitoring activities across tributaries, compatible with emerging mainstem monitoring and existing estuary monitoring efforts.
3. Working to develop a shared data management system.
4. Identifying priority contaminants for future monitoring efforts.
5. Holding an annual meeting to discuss and identify research needs.

Don't:

1. Repeat CRBRP Work Group
2. Be prescriptive

Meeting 1

Facilitate Development of Strategy for Monitoring and Data Sharing

Topic #1: Should there be a document describing agreed upon sampling and analytical methods and concerns for Columbia River toxics monitoring? Who would prepare it?

Topic #2: What are the monitoring gaps of greatest concern?

Topic #3: We propose that toxics monitoring data be published to the EPA Exchange Network's WQX data system and that we create a new dashboard to access CRB data from the WQX.

Meeting 2

Facilitate Development of Strategy for Monitoring and Data Sharing

Topic #1: Continue discussion of the data sharing proposal (i.e., that toxics monitoring data be published to the EPA Exchange Network's WQX data system and that we create a new dashboard to access CRB data from the WQX).

Topic #2: Discuss holding an annual research and emerging concerns workshop.

Topic #3: Review CRB Contaminants of Concern Framework (finalized August 2020) and discuss plan to revisit as needed.

Topic 1: Quality Assurance Project Plans

Presentation by
Donald M. Brown

Regional Quality Assurance
Manager

Laboratory Services and
Applied Science Division
USEPA Region 10

Quality Assurance Project Plans

This presentation gives an overview of four different types of Quality Assurance Project Plans (QAPPs)

Project QAPP

Generic QAPP

Programmatic QAPP

Umbrella QAPP

When is a QAPP Needed?

QAPPs required for all environmental information collection, generation, evaluation, and use activities.

- Direct measurements of environmental parameters
- Analytical testing results
- Information on physical parameters or processes collected using environmental technologies
- Calculations or analyses of environmental information
- Information provided by models
- Information compiled or obtained by databases, software applications, decision support tools, websites, or existing literature
- Development of environmental software, tools, models, methods and applications
- Design, construction, and operation or application of environmental technology

Project QAPP

A formal document describing in comprehensive detail the necessary quality assurance (QA), quality control (QC), and other technical activities that will be implemented to ensure the results of the work performed will satisfy the stated performance criteria.

Four Elements:

- Project Management
- Data Generation & Acquisition
- Assessment & Oversight
- Data Validation and Usability

- ✓ Goals developed via systematic planning
- ✓ Usually addresses one goal, DQO, or data use
- ✓ Defined start and end dates

Generic QAPP

An overarching plan that describes the data quality objectives and documents a comprehensive set of sampling, analysis, QA/QC, data review, and assessment procedures specific to a large program or long-term project.

Makes sense in situations where **multiple sites, systems, or projects will be sampled under a common sampling and analysis protocol.**

How to determine if a Generic QAPP is right for your project:

Consider whether there is sufficient consistency across the QA needs of multiple projects within a program that combining the planning into a single, generic QAPP will:

Ensure the necessary level of quality for all projects covered by the generic QAPP

Require less time and resources to manage with a single generic QAPP than with multiple project-specific QAPPs

Programmatic QAPP

Establish policies that define and document the type and quantity of data needed for program-level environmental decisions and to describe the methods required for collecting, analyzing, and assessing data to support those decisions.

- ✓ Usually goals are linked to a regulation or statute
- ✓ No defined start or stop date
- ✓ Would describe QA requirements for the program

How does a Programmatic QAPP differ from a Generic QAPP?

Associated with an environmental program

Describes policies regarding the type of grants, contracts, cooperative agreement or activities that would require QA documentation

Program goals are typically associated with an environmental regulation

Umbrella QAPP

Subset of a generic or programmatic QAPP in that information not covered by the parent QAPP is documented in detail in an addenda or site-specific sampling plan. The umbrella QAPP would specify the preparation, review, and approval of task- or project-specific addenda.

- ✓ Could require separate approval for each addenda by all project approvers

Synopsis

| Project | Generic | Programmatic | Umbrella |
|--|--|---|--|
| <ul style="list-style-type: none">• Defined start and stop• One goal, objective, and/or DQO <p><i>Use for an individual project</i></p> | <ul style="list-style-type: none">• Common sampling and analysis protocol for all projects• Similar level of quality needed for all projects <p><i>Use when there are multiple projects that have a similar goal but there are common elements that can be referenced</i></p> | <ul style="list-style-type: none">• Linked to regulation/statute• Define QA requirements for how the program would operate <p><i>Use when associating to a program or regulation</i></p> | <ul style="list-style-type: none">• Addenda required for detailed project info• Each addenda would need a separate approval mechanism <p><i>Use when there are project components that would be better defined in addenda keeping in mind the umbrella portion would house common elements to the project/program</i></p> |

Questions?

Manuals Used in the National Aquatic Resource Surveys

Various manuals are used to communicate the methods and guidelines for the National Aquatic Resource Surveys (NARS):

- **Field Operations Manual:** Outlines the field protocols that crews will utilize to sample sites
- **Lab Operations Manual:** Contains the methods for sample analysis
- **Quality Assurance Project Plan:** Identifies the quality control measures in place to validate the quality of the data and collection
- **Site Evaluation Guidelines:** Provides guidance on site assessment that must be done ahead of a sampling visit to ensure the site is sampleable and fits within the site requirements

Great Lakes Monitoring

During the spring and summer, EPA's research vessel, the [Lake Guardian](#), is used to help scientists sample water, aquatic life, sediments and air. Data gathered shows trends in water quality and aquatic life. Researchers are then able to determine the overall health of the Great Lakes ecosystem.

National Aquatic Resource Surveys (NARS)

Statistical surveys designed to assess the status of and changes in quality of the nation's coastal waters, lakes and reservoirs, rivers and streams, and wetlands.

Use sample sites selected at random to provide a snapshot of the overall condition of the nation's water.

Use standardized field and lab methods to allow comparison of results from different parts of the country and between years.

EPA works with state, tribal and federal partners to design and implement NARS

Example
management
questions
addressed by
NARS

What percent of waters support healthy ecosystems and recreation?

What are the most common water quality problems?

Is water quality improving or getting worse?

Are investments in improving water quality focused appropriately?

Great Lakes Emerging Chemical Surveillance Program

The Emerging Chemical Surveillance Program screens for emerging chemicals in fish tissue according to their persistent, bioaccumulative, and/or toxic chemical properties. This element of the Great Lakes Fish Monitoring and Surveillance Program is geared toward current use chemicals, chemicals currently under regulation, and or newly identified chemicals. Information gained from this program is used to identify and guide state and federal monitoring programs. The [Great Lakes Fish Monitoring and Surveillance Program](#) uses the information to decide what contaminants might need to be monitored on a regular basis.

Types of chemicals identified through the Emerging Chemical Surveillance Program include:

- Surfactants
- Flame Retardants
- Pharmaceuticals
- Personal Care Products
- Musk and Fragrances
- Unregulated industrial chemicals

Related Information
[Contaminants of Emerging Concern](#)

Assessing the health of the Great Lakes is a complex issue and involves an understanding of the chemical, physical, and biological processes within the Lakes. For this reason, the Great Lakes Fish Monitoring and Surveillance Program is including several special studies as part of the Program to help assess Great Lakes Health. Additional studies to complement the base Great Lakes Fish Monitoring and Surveillance Program work include:

- An assessment of chemicals present in individual top predators in one lake per year to compare to composite samples.

Chemical Analysis

Chemical analysis for the GLFMSP is conducted through a cooperative agreement with Clarkson University. In 2015, EPA awarded Clarkson a grant to continue monitoring Great Lakes fish for contamination from legacy pollutants such as PCBs and banned pesticides and from emerging chemicals of concern. For more information about the chemical analysis, contact [Dr. Thomas M. Hansen](#).

Discussion questions for Topic 2

What (if any) management questions do we have that would drive the need for a Basin-wide design? e.g.

- Comparisons between geographical areas (and/or at different spatial scales)
- Comparisons over time (are conditions getting better or worse)

Are the chemicals and media (ie. water, sediment, and fish tissue) of concern consistent enough to warrant coordinated monitoring?

slido

What (if any) management questions do we have that would drive the need for a Basin-wide design?

① Start presenting to display the poll results on this slide.

slido

Topic 3: What else do you need to be successful in moving towards a coordinated Columbia River basin-wide Toxics Monitoring Strategy?

Questions for attendees:

- Training
- Capacity/staff support
- Methods library in general
- Monitoring design support
- Design documentation
- Map of monitoring sites
- Anything else?

slido

What type of training are you interested in?
