

# U.S. EPA's Tools for Monitoring and Responding to HABs in Recreational Waters

John Healey  
September 26, 2019  
Region 10 CyanoHABs Pre-Workshop Webinar

Disclaimer: The Views Expressed Here are Those of the Author and Not Necessarily those of the EPA

# Presentation Overview

- Overview of harmful algal blooms (HABs) and cyanotoxins in recreational waters
- Discussion of tools for waterbody managers to monitor for and respond to CyanoHABs
  - Monitoring and responding to cyanobacteria and cyanotoxins in recreational waters
  - Communicating about cyanobacterial blooms and toxins in recreational waters

# Recreational Water Quality Criteria

- EPA develops and recommends criteria to protect people from organisms, such as viruses and bacteria, and their associated toxins in water bodies (e.g., lakes, rivers, beaches). State and tribal governments can use the criteria as guidance when setting their own water quality standards to protect human health.
- 2012 Recreational Water Quality Criteria for Pathogens
- 2016 Coliphage Expert Workshops (potential for coliphage-based criteria)
- 2019 [Recreational Water Quality Criteria and Swimming Advisories for Cyanotoxins](#) (total microcystins and cylindrospermopsin)

# HAB-Related Recreational Water Challenges

- Human health effects from ingesting toxins: gastroenteritis, liver and kidney damage. The criteria were developed based on children's recreational exposures and are considered protective of other age groups.
- Animal health effects: Animals, such as dogs or cattle, are likely to be affected during a HAB event because they are likely to drink from or swim in waters that contain HABs. The Centers for Disease Control and Prevention (CDC) maintains [One Health Harmful Algal Bloom System \(OHHABS\)](#), a voluntary reporting system available to state and territorial public health departments and their designated environmental health or animal health partners. It collects data on individual human and animal cases of illnesses from HAB-associated exposures, as well as environmental data about HABs.

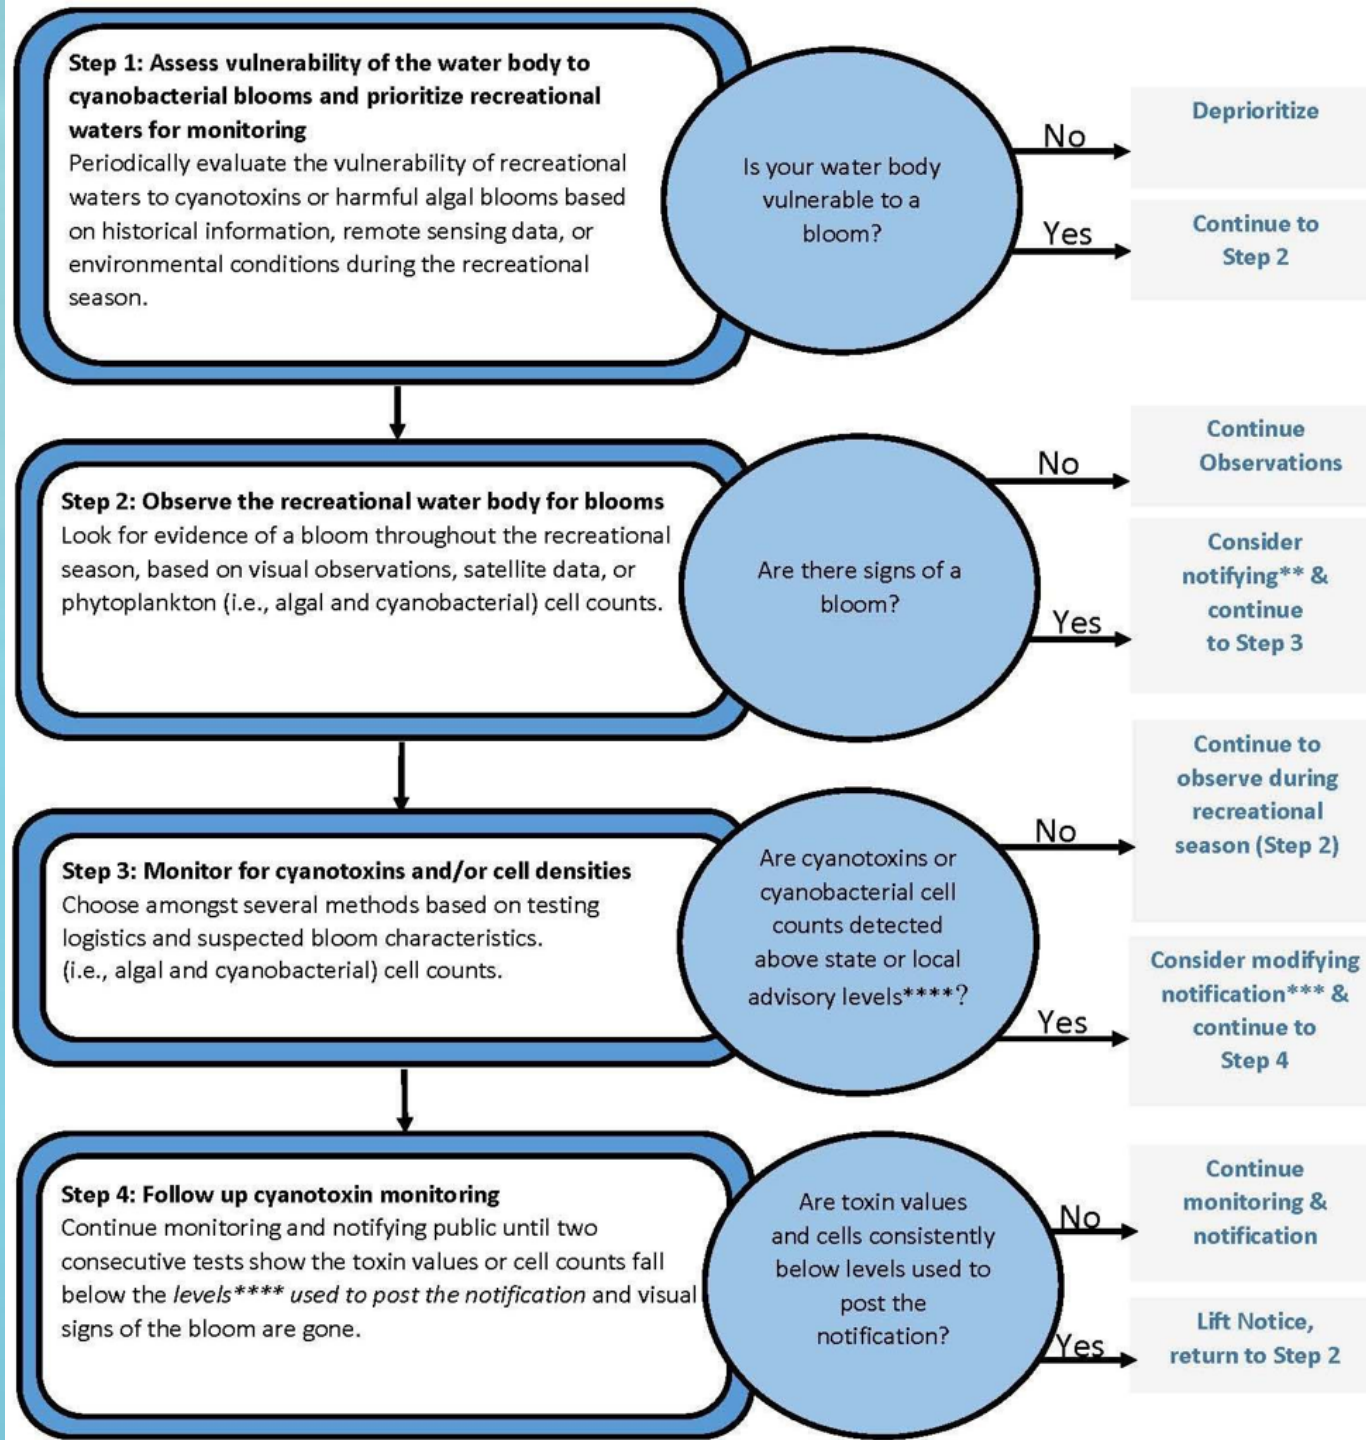

# EPA HAB Monitoring and Response Tools

- Monitoring and responding to HABs:

## Monitoring and Responding to Cyanobacteria and Cyanotoxins in Recreational Waters

This information is intended for recreational waterbody managers, which may include public health officials, lake managers, or other state, local or tribal officials, involved in monitoring water quality and protecting the health of people and animals that use waterbodies within their jurisdiction.

**DISCLAIMER:** *This information does not impose legally binding requirements on the EPA, states, tribes, or the public, nor does it confer legal rights. It does not constitute a regulation, nor does it change or substitute for any Clean Water Act provision or EPA regulation. Any mention of trade names, products, or services does not convey and should not be interpreted as conveying official EPA approval, endorsement, or recommendation for use.*

### Visual Signs of a Cyanobacterial Bloom

Visual signs of a bloom include:

- surface water discoloration (e.g., a green, white, brown, red, or blue tint);
- reduced transparency (e.g., water that looks like pea soup or lets limited light through); and/or

## Communicating about Cyanobacterial Blooms and Toxins in Recreational Waters

EPA designed the tools on this page to support states, tribes, territories, and local governments as they develop their own risk communication materials. The tools can help water managers inform people using recreational waters, as well as pet and livestock owners, of the health risks associated with cyanobacteria and their toxins in lakes, rivers or other recreational water bodies.

Communication to the public may occur through signage at the recreational water body; radio and TV announcements; and/or social media. Messages should clearly define levels of risk and of potential contamination, such as the exposure potential for specific recreational activities. Managers should also be aware that toxins may be transported and affect downstream waters.

**DISCLAIMER:** *This information does not impose legally binding requirements on the EPA, states, tribes, or the public, nor does it confer legal rights. It does not constitute a regulation, nor does it change or substitute for any Clean Water Act provision or EPA regulation. Any mention of trade names, products, or services does not convey and should not be interpreted as conveying official EPA approval, endorsement, or recommendation for use.*

# LOOK OUT FOR HARMFUL ALGAL BLOOMS

A **harmful algal bloom (HAB)** is an overgrowth of algae in a water body that could affect water quality and aquatic life. Some HABs produced by bacteria can create toxins that may also harm people, animals, and the local environment.

## HOW TO IDENTIFY A HARMFUL ALGAL BLOOM

Algal blooms can make the water appear green, blue, brown, gold, or red.

Seeing colors, scum, mats, foam, or paint-like streaks in the water or clumps on the shore may indicate a bloom. However, only professional water testing can confirm if HABs and toxins are present. States often have monitoring programs for this purpose.

**EXPOSED?**  
Shower immediately.  
See a doctor or vet if  
symptoms occur.

## SYMPTOMS OF EXPOSURE

Vary depending on how the person or animal was exposed, and whether the HAB is in salt or fresh water.

Ear, eye, nose,  
skin, and throat  
irritation, and  
headache

Paralysis,  
respiratory  
illness, and  
seizures

Abdominal pain,  
diarrhea, liver and  
kidney damage, and  
vomiting

Drooling, diarrhea,  
low energy, not  
eating, stumbling,  
tremors, and  
vomiting

## WHEN IN DOUBT, STAY OUT!

Stay away from the water when a suspected HAB is present.

**DON'T**  
Play with scum  
or mats on the  
shore

**DON'T**  
Let animals  
drink water, eat  
algae, or swim

**DON'T**  
Swim

**DON'T**  
Fish or wade

**DON'T**  
Boat or kayak
