NOTE:

FS - fillet with skin AFC - average fish consumption
WB - whole body HFC - high fish consumption

Risk for General Public:

AFC - risk based on mean U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 7.5 g/day (12 meals/yr) (USEPA 2000a)

HFC - risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 142.4 g/day (19 meals/mo) (USEPA 2000a)

Risk for Native American:

AFC - risk based on mean consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 63.2 g/day (2 meals/wk) (CRITFC 1994)

HFC - risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 389 g/day (12 meals/wk) (CRITFC 1994)

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Total Aroclors - based on Aroclor 1254 in FS and sum of Aroclors 1254 and 1260 in WB; risk calculated using RfD for Aroclor 1254

Appendix G1: Noncarcinogenic Risk Estimate for Adults
General Public and Native American Population

Anadromous Fish: Pacific lamprey
Fillet with skin, and whole body samples

Total DDT - sum of o,p' and p,p' isomers of DDT and its derivatives (DDD and DDE); risk calculated using RfD for DDT

Appendix G1: Noncarcinogenic Risk Estimate for Adults
General Public and Native American Population

Anadromous Fish: Pacific lamprey
Fillet with skin, and whole body samples

NOTE:

FS - fillet with skin AFC - average fish consumption
WB - whole body HFC - high fish consumption

Risk for General Public:

AFC - risk based on mean U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 2.83 g/day (5 meals/yr) (USEPA 2000a)

HFC - risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 77.95 g/day (11 meals/yr) (USEPA 2000a)

Risk for Native American:

AFC - risk based on mean consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 24.8 g/day (40 meals/yr) (CRITFC 1994)

HFC - risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 162 g/day (5 meals/wk) (CRITFC 1994)

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Total Aroclors - based on Aroclor 1254 in FS and sum of Aroclors 1254 and 1260 in WB; risk calculated using RfD for Aroclor 1254

Appendix G2: Noncarcinogenic Risk Estimate for Children
General Public and Native American Population

Anadromous Fish: Pacific lamprey
Fillet with skin and whole body samples

Total DDT - sum of o,p' and p,p' isomers of DDT and its derivatives (DDD and DDE); risk calculated using RfD for DDT

Metals	Zinc	WB	1.2	21	Willamette River
Metals	Zinc	WB	0.81	24	Fifteen Mile Ck

NOTE:

FS - fillet with skin

WB - whole body

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Total Aroclors - based on Aroclor 1254 in FS and sum of Aroclors 1254 and 1260 in WB; risk calculated using RfD for Aroclor 1254

Total DDT - sum of o,p' and p,p' isomers of DDT and its derivatives (DDD and DDE); risk calculated using RfD for DDT

NOTE:

Health endpoints with only one contributing chemical are not shown: gastrointestinal or intestinal lesions (beryllium), argyria (silver), thyroid (mirex), clinical signs (2,4-Dimethylphenol), selenosis (selenium), and hyperpigmentation/keratosis (arsenic).

Blank cell indicates that chemical was not detected.

na - sample type was not analyzed at that site

FS - fillet with skin

WB - whole body

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Total Aroclors - sum of Aroclors: 1254 in FS and at Site 24 in WB, 1254 and 1260 at Site 21 in WB; risk calculated using RfD for Aroclor 1254

Total DDT - sum of o,p' and p,p' isomers of DDT and its derivatives (DDD and DDE); risk calculated using RfD for DDT

Site 21 - located in the Willamette River

Site 24 - located in the Fifteen Mile Creek

NOTE:

FS - fillet with skin

WB - whole body

Risk estimates for detected chemicals only

Risk for General Public:

AFC - risk based on mean U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 7.5 g/day (12 meals/yr) (USEPA 2000a)

HFC - risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 142.4 g/day (19 meals/mo) (USEPA 2000a)

Risk for Native American:

AFC - risk based on mean consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 63.2 g/day (2 meals/wk) (CRITFC 1994)

HFC - risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River 389 g/day (12 meals/wk) (CRITFC 1994)

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Adjusted Aroclors - risk associated with non-dioxin-like PCB congeners

NOTE:

FS - fillet with skin

WB - whole body

Risk estimates for detected chemicals only

Risk for General Public:

AFC - risk based on mean U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 7.5 g/day (12 meals/yr) (USEPA 2000a)

HFC - risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish, 142.4 g/day (19 meals/mo) (USEPA 2000a)

Risk for Native American:

AFC - risk based on mean consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 63.2 g/day (2 meals/wk) (CRITFC 1994)

HFC - risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin, 389 g/day (12 meals/wk) (CRITFC 1994)

Chlordane (total) - sum of cis-chlordane, cis-nonachlor, gamma-chlordane, oxychlordane, and trans-nonachlor

Adjusted Aroclors - risk associated with non-dioxin-like PCB congeners

Radionuclide Data

January 2002

**Prepared by
U.S. Environmental Protection Agency
Region 10
Seattle, Washington**

Explanation of column headings in radionuclide data

Client ID: Region 10 sample identifier.

Matrix: fish in this case.

NAREL ID: Laboratory sample identifier.

Collect Start/end: sample collection date.

Ana. ID: Analyst identifier.

QC: Type of QC sample (if applicable).

Procedure: Type of analysis. ALPBET for gross alpha/beta, GAMMA for gamma spectroscopy, U for uranium, PU for plutonium, SR for strontium.

Aliquot: Amount of sample used.

Unit: Units of aliquot.

Dry/wet: Ratio of sample dry weight to wet weight.

Ash/dry: Ratio of sample ash weight to dry weight.

Analyte: Radionuclides analyzed.

Conc: Concentration

2*CSU: Two standard deviations of the concentration.

MDC: Minimum detectable concentration for the analysis.

Unit: Units for Conc, 2*CSU and MDC.

Res Date: The date to which analysis results were decay-corrected.

Hazard Indices Across Study Sites

July 2002

**Prepared by
U.S. Environmental Protection Agency
Region 10
Seattle, Washington**

M.1 Comparison of Hazard Indices Across Sites and Among Species

Non-cancer hazards were estimated for fish collected in the Columbia River Basin as described in Section 6. Graphical representations of the data are presented in this section to show hazard indices for multiple species, sample types, and sites.

To show the greatest number of hazard indices, the scenario that generates the highest risk estimates - a CRITFC's member tribal child with a high fish consumption rate (162 g/day) - was chosen to compare estimates among species and sampled sites. Total hazard indices are shown for all fish species. In addition to total hazard indices, endpoint specific hazard indices which exceeded 1.0, are shown for the liver health endpoint, the central nervous system health endpoint, the immune system health endpoint, and the reproduction/development health endpoint. These four health endpoints are presented because they tended to have the highest hazard index values and exceeded 1.0 in the most fish species for a CRITFC's member tribal child with a high fish consumption rate.

M.1.1 Resident Fish Species

Samples of six resident fish species—bridgelip sucker, largescale sucker, mountain whitefish, white sturgeon, walleye, and rainbow trout—were collected from the following sites in the Columbia River Basin:

- Site 6 - located in the Columbia River between the Bonneville Dam and the Dalles Dam
- Site 7 - located in the Columbia River between the Dalles Dam and the John Day Dam
- Site 8 - located in the Columbia River between the John Day Dam and the McNary Dam
- Site 9L - located in the upper Columbia River below the Snake River
- Site 9U - located in the upper Columbia River above the Snake River
- Site 56 - located in the Klickitat River
- Site 98 - located in the Deschutes River
- Site 30 and 101 - located in the Umatilla River
- Site 48 and 49 - located in the Yakima River

Total hazard indices and hazard indices for four health endpoints for the six resident fish species are presented in Figures 6-1 through 6-10. Note that the hazard index scales on the Y axes differ, ranging from 0.1 to 100 for the endpoints for central nervous system, reproduction/developmental, and liver, and from 0.1 to 1000 for the endpoint of immunotoxicity and for total hazard index.

It is difficult to draw conclusions from these figures because different species were sampled at different locations. However, it appears that for the endpoint specific hazard indices for liver and the immune system and for total hazard indices for a given species, some sites (e.g., 56, 98, 30 and 101) tend to have lower values than the other sampled sites. The central nervous system and reproduction/development health endpoints did not show as much of a trend. This may be because these health endpoints are driven by concentrations of mercury, which appear to be more evenly distributed among the fish tissues collected within the Columbia River.

Total Hazard Indices

Total hazard indices for the CRITFC's member tribal child with a high fish consumption rate (162 g/day) ranged in value from 15 for whole body rainbow trout at site 101 to a high of 290 for fillet without skin samples of white sturgeon at site 9U. White sturgeon at Sites 9L and 9U and mountain whitefish at Site 48 had the highest total hazard indices in fillet samples (Figure 6-1). The highest total hazard indices in whole-body samples occurred for walleye at Site 7; white sturgeon at Site 8, 9L, and 9U; mountain whitefish at Site 9U and Site 48; and largescale sucker at Site 9U and Site 48 (Figure 6-2).

Liver Health Endpoint

Hazard indices for the liver health endpoint ranged from a low of 1 for rainbow trout at site 101, whole body samples, to a high of 41 for white sturgeon, fillet without skin samples, at site 9U. The highest hazard indices for the liver health endpoint in fillet samples occurred for white sturgeon at all Columbia River sites and Site 13, mountain whitefish at Site 9U and Site 48, and largescale sucker at Site 48 (Figure 6-3). The highest hazard indices for the liver health endpoint in whole-body samples occurred for largescale sucker at Site 9U and Site 48; white sturgeon at Sites 8, 9L, and 9U; mountain whitefish at Site 48, and walleye at Site 7 (Figure 6-4).

Central Nervous System Health Endpoint

Hazard indices for the central nervous system health endpoint ranged from a low of 4.3 for mountain whitefish fillets at site 8 to a high of 39 for largescale sucker fillets at site 13. The highest hazard indices for the central nervous system health endpoint in fillet samples occurred for largescale sucker at Sites 9U, 30, 13, 48, 49; white sturgeon at all Columbia River sites and Site 13; walleye at Site 30; and mountain whitefish at Site 48 (Figure 6-5). The highest hazard indices for the central nervous system health endpoint in whole-body samples, occurred for largescale sucker at Sites 8, 9U, 98, 13, 48, 49; walleye at Site 7 and Site 30; white sturgeon at Site 8 and Site 9L; and rainbow trout at Site 98 (Figure 6-6).

Figure 6-1. Total hazard indices in fillet samples of resident fish species by site

Figure 6-2. Total hazard index in whole body samples of resident fish species by site

Figure 6-3. Hazard indices for the liver health endpoint in fillet samples of resident fish species by site

Figure 6-4. Hazard indices for the liver health endpoint in wholebody samples of resident fish species by site

Figure 6-5. Hazard indices for the central nervous system health endpoint in fillet samples of resident fish species by site

Figure 6-6. Hazard indices for the central nervous system health endpoint in whole body samples of resident fish species by site

Immune System Health Endpoint

Hazard indices for the immune system health endpoint ranged from 4.8 for whole body rainbow trout samples at site 101 to a high of 270 for mountain whitefish at site 9U. The highest hazard indices for the immune system health endpoint in fillet samples for mountain whitefish were at Site 9U and 48 and for white sturgeon at Site 9U (Figure 6-7). The highest hazard indices for the immune system health endpoint in whole-body samples occurred for mountain whitefish at Site 9U and white sturgeon at Site 8 (Figure 6-8).

Reproduction/Development Health Endpoint

Hazard indices for the reproduction/development health endpoint are similar to those for the central nervous system. The highest hazard indices for the reproduction/development health endpoint in fillet samples occurred for largescale sucker at Sites 9U, 30, 13, 48, 49, and 98; white sturgeon at Sites 6, 7, 9L, 9U, and 13; walleye at Site 30, and mountain whitefish at Site 48 (Figure 6-9). The highest hazard indices for the reproduction/development health endpoint in whole-body samples occurred for walleye at Site 7 and Site 30; white sturgeon at Site 8 and Site 9L, largescale sucker at Sites 8, 9U, 98, 48, and 49; and rainbow trout at Site 98 (Figure 6-10).

Figure 6-9. Hazard indices for the reproduction/development health endpoint in fillet samples of resident fish species by site

Figure 6-10. Hazard Indices for the reproduction/developmental health endpoint in whole body samples of resident fish species by site

M.1.2 Anadromous Fish Species

Samples of anadromous fish, coho salmon, fall chinook salmon, spring chinook salmon, steelhead, eulachon, and Pacific lamprey, were collected from the following sites in the Columbia River Basin:

- Site 8 - located in the Columbia River between the John Day Dam and the McNary Dam
- Site 14 - located in the upper Columbia River above the Snake River
- Site 21 - located in the Willamette River
- Site 63 - located in the Wind River
- Site 62 - located in the Little White Salmon River
- Site 25 - located in the Hood River
- Site 56 - located in the Klickitat River
- Site 24 - located in Fifteen Mile Creek
- Site 98 - located in the Deschutes River
- Site 30 - located in the Umatilla River
- Site 93 - located in the Snake River
- Site 96 - located in the Clearwater River
- Site 48 - located in the Yakima River
- Site 51 - located in the Wenatchee River

Total hazard indices and hazard indices for four health endpoints for the anadromous fish species are presented in Figures 6-11 through 6-20. In general, total hazard indices, liver health endpoint hazard indices, and immune system health endpoint hazard indices were much lower in most anadromous fish species compared to most of the resident fish species. Hazard indices for the central nervous system and reproduction/development health endpoints were similar in magnitude between anadromous and resident fish species.

Total Hazard Indices

Total hazard indices ranged from a low of 8.6 in whole body eulachon to a high of 99 in whole body Pacific lamprey at site 24. The highest total hazard indices in fillet samples occurred for Pacific lamprey at Site 21 (Figure 6-11). The highest total hazard indices in whole-body samples, occurred for Pacific lamprey at Site 24 (Figure 6-12).

Liver Health Endpoint

Hazard indices for the liver health endpoint in anadromous fish species were all less than 10. The highest hazard index for the liver health endpoint occurred for Pacific lamprey at Site 21 (Figure 6-13). The highest hazard indices for the liver health endpoint in whole-body samples occurred for Pacific lamprey at Sites 21 and 24 (Figure 6-14).

Central Nervous System Health Endpoint

Hazard indices for the central nervous system health endpoint in anadromous fish ranged from a

low of 4.2 for whole body fall chinook at site 56 to a high of 33 for spring chinook fillet at site 56. The highest hazard indices in fillet samples occurred for spring chinook salmon at Sites 56 and 51 and fall chinook salmon at Site 14 (Figure 6-15). The highest hazard indices in whole-body samples occurred for steelhead at Site 93 and Site 96, Pacific lamprey at Site 24, coho salmon at Site 30, and spring chinook salmon at Site 56 (Figure 6-16).

Figure 6-11. Total hazard index in fillet samples of anadromous fish species by site

Figure 6-15. Hazard indices for the central nervous system health endpoint in fillet samples of anadromous species by site

Figure 6-16. Hazard indices for the central nervous system health endpoint in whole body samples of anadromous fish species by site

Immune System Health Endpoint

The lowest hazard index for the immune system was 1.2 for spring chinook fillets at site 56 and the high was 70 for whole body Pacific lamprey at site. The highest hazard indices in fillet samples occurred for Pacific lamprey at Site 21, fall chinook salmon at Site 14, coho salmon at Site 30, and steelhead at Sites 96 and 48 (Figure 6-17). The highest hazard indices for whole-body samples occurred for Pacific lamprey at Site 21 and Site 24; coho salmon at Site 30; fall chinook salmon at Site 14 and Site 30, and steelhead at Sites 93, 96, and 48 (Figure 6-18).

Reproduction/Development Health Endpoint

The hazard indices for the reproduction/development health endpoint in anadromous fish species were similar to those for the central nervous system. The highest hazard indices in fillet samples occurred for spring chinook salmon at Site 56; steelhead at Sites 25, 56, 93, 96, and 48; fall chinook salmon at Site 14, and coho salmon at Site 30 (Figure 6-19). The highest hazard indices in whole-body samples occurred for steelhead at Site 93 and Site 96, Pacific lamprey at Site 24, coho salmon at Site 30, spring chinook salmon at Site 56, and fall chinook salmon at Site 14 and Site 48 (Figure 6-20).

**COLUMBIA RIVER BASIN FISH
CONTAMINANT SURVEY**

**VOLUME I
Appendix N**

Estimated Cancer Risks by Study Site

July 2002

**Prepared by
U.S. Environmental Protection Agency
Region 10
Seattle, Washington**

N.1 Cancer Risk Comparisons

Cancer risks were estimated for fish collected in the Columbia River Basin as described in Section 6. Graphical representations of the data are presented in this section to show risk estimates for multiple species, sample types, and sites. Total cancer risk at or above 1×10^{-6} are focused upon in the discussion in this Appendix.

N.1.2 Carcinogenic Risk Estimates

Upper bound total cancer risk estimates are presented graphically across a range of consumption rates from 0.6 g/day to 540 g/day for 30- and 70-year exposure durations. Each graph represents only one sampling site. Assuming a typical meal size of 8 ounces, 0.6 g/day corresponds to a consumption rate of one meal per year. The upper value, 540 g/day, corresponds to 900 meals per year, the maximum suggested fish consumption rate for tribal subsistence fishers within the Columbia River basin (Harris and Harper 1997). This range of consumption rates allows the reader to identify cancer risks associated with personal consumption patterns. Four drop lines are included in the plots to guide the reader in finding the cancer risk estimates corresponding to the consumption rates used in this report. The consumption rate of 7.5 g/day (12 meals/yr) corresponds to an adult in the general public with an average fish consumption rate, 63.2 g/day (103 meals/yr) corresponds to an adult in the CRITFC 's member tribal population with an average fish consumption rate, 142.4 g/day (232 meals/yr) corresponds to an adult in the general public with a high fish consumption rate, and 389 g/day (634 meals/yr) corresponds to an adult in the CRITFC 's member tribal population with a high fish consumption rate.

N.3 Cancer Risk Estimates by Site

N.3.1 Columbia River

Seven sites were sampled in the Columbia River, Sites 3, 6, 7, 8, 9L, 9U, and 14. At two sites in the Columbia River, Site 8 and Site 9U, more than one species with the same tissue type were collected, allowing for comparison of estimated cancer risk among these species.

Site 3 is located between the mouth of the Columbia River and Bonneville Dam. One species and sample type was collected at this site, whole-body samples of eulachon. Estimated cancer risk estimates were at or above 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration (Figure 6-21).

Site 6 is located between the Bonneville Dam and the Dalles Dam. One species and sample type was collected at this site, fillet samples of white sturgeon. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations (Figure 6-22).

Site 7 is located between the Dalles Dam and the John Day Dam. Fillet samples of white sturgeon and whole-body samples of walleye were collected at this site. Cancer risk estimates for

both of the fillet and whole-body samples at Site 7 exceeded 1×10^{-6} at 30- and 70-year exposure durations (Figures 6-23 and 6-24).

Site 8 is located between the John Day Dam and the McNary Dam. Fillet samples of three species were collected at this site, fall chinook salmon, steelhead, and white sturgeon. Cancer risk estimates for fillet samples exceeded 1×10^{-6} for all three species at a 70-year exposure duration. At a 30-year exposure duration, cancer risk estimates exceeded 1×10^{-6} except for fall chinook salmon and steelhead at low consumption rates. The highest cancer risk estimates in fillet samples occurred in white sturgeon followed, in decreasing order, by fall chinook salmon and steelhead (Figure 6-25). Whole-body samples of four species were collected at this site, fall chinook salmon, largescale sucker, steelhead, and white sturgeon. Cancer risk estimates for whole-body samples exceeded 1×10^{-6} at a 70-year exposure duration. At a 30-year exposure duration, cancer risk estimates in whole-body samples exceeded 1×10^{-6} except for fall chinook salmon and steelhead at low consumption rates. The highest cancer risk estimates in whole-body samples occurred in white sturgeon, followed, in decreasing order, by largescale sucker, fall chinook salmon, and steelhead (Figure 6-26).

Site 9L is located in the Columbia River below the Snake River. One species was collected at this site, white sturgeon. Cancer risk estimates for fillet and whole-body samples at Site 9L exceeded 1×10^{-6} at 30- and 70-year exposure durations. Cancer risk estimates were slightly higher in fillet samples than in whole-body samples (Figure 6-27).

Site 9U is located in the Upper Columbia River above the Snake River. Three species were collected at this site, largescale sucker, mountain whitefish, and white sturgeon. Cancer risk estimates for fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations. Mountain whitefish had the highest cancer risk estimates followed, in decreasing order, by white sturgeon, and largescale sucker (Figures 6-28 and 6-29).

Figure 6-28. Excess cancer risk estimates for fillet samples of fish species collected at Site 9U, Columbia River

Figure 6-29. Excess cancer risk estimates for whole body samples of fish species collected at Site 9U, Columbia River

Site 14 is located in the Upper Columbia River above the Snake River. One species was collected at this site, fall chinook salmon. Cancer risk estimates for fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations (Figure 6-30).

N.3.2 Willamette River

One sampling site was located in the Willamette River, site 21. Two species were collected at this site, Pacific lamprey and spring chinook salmon. Cancer risk estimates for fillet samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for spring chinook salmon at very low consumption rates with a 30-year exposure duration. The highest cancer risk estimates occurred for Pacific lamprey followed by spring chinook salmon (Figure 6-31 and 6-32). The highest cancer risk estimates occurred for Pacific lamprey followed by spring chinook salmon .

N.3.3 Wind River

One sampling site was located in the Wind River, Site 63. One species was collected at this site, spring chinook salmon. Cancer risk estimates for both fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for the lowest consumption rates with a 30-year exposure duration (Figure 6-33).

N.3.4 Little White Salmon River

One sampling site was located in the Little White Salmon River, Site 62. One species was collected at this site, spring chinook salmon. Cancer risk estimates for both fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration (Figure 6-34).

N.3.5 Hood River

One sampling site was located in the Hood River. One species was collected at this site, steelhead. Cancer risk estimates for both fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations. Cancer risk estimates were slightly higher in fillet samples than in whole-body samples (Figure 6-35).

Figure 6-30. Excess cancer risk estimates for samples of fall chinook collected at Site 14, Columbia River

Figure 6-34. Excess cancer risk estimates for samples of spring chinook collected at Site 62, Little White Salmon River

Figure 6-35. Excess cancer risk estimates for samples of steelhead collected at Site 25, Hood River

N.3.6 Klickitat River

One sampling site was located in the Klickitat River, site 56. Three species were collected at this site for fillet samples, fall chinook salmon, spring chinook salmon, and steelhead. Cancer risk estimates for fillet samples exceeded 1×10^{-6} at 70-year exposure durations; 1×10^{-6} was exceeded at 30 years, except for lowest consumption rates. The highest cancer risk estimates occurred for steelhead followed, in decreasing order, by spring chinook salmon and fall chinook salmon (Figure 6-36). Four species were collected at this site for whole-body samples, fall chinook salmon, rainbow trout, spring chinook salmon, and steelhead. Cancer risk estimates for whole-body samples exceeded 1×10^{-6} at 70-year exposure durations; 1×10^{-6} was exceeded at 30 years, except for lowest consumption rates. The highest cancer risk estimates occurred for spring chinook salmon followed, in decreasing order, by steelhead, fall chinook salmon, and rainbow trout (Figure 6-37).

N.3.7 Fifteen Mile Creek

One sampling site was located in Fifteen Mile Creek, site 24. One species and sample type was collected at this site, whole-body samples of Pacific lamprey. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations (Figure 6-38).

N.3.8 Deschutes River

One sampling site was located in the Deschutes River, site 98. Three species were collected at this site, largescale sucker, mountain whitefish, and rainbow trout. Cancer risk estimates in fillet samples exceeded 1×10^{-6} at a 70-year exposure duration. At a 30-year exposure duration, cancer risk estimates exceeded 1×10^{-6} except in rainbow trout and largescale sucker at low consumption rates. The highest cancer risks estimated in fillet samples occurred for mountain whitefish followed, in decreasing order, by rainbow trout, and largescale sucker (Figure 6-39). Cancer risk estimates in whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates at a 30-year exposure duration in rainbow trout. The highest cancer risk estimates in whole-body samples occurred for mountain whitefish followed, in decreasing order, by largescale sucker and rainbow trout (Figure 6-40).

N.3.9 Umatilla River

Two sampling sites were located in the Umatilla River, Sites 30 and 101. Five species were collected at Site 30, coho salmon, fall chinook salmon, largescale sucker, spring chinook salmon and walleye. Cancer risk estimates in fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates at a 30-year exposure duration. The highest cancer risk estimates in fillet samples occurred for spring chinook salmon followed, in decreasing order, by coho salmon, largescale sucker, walleye, and fall chinook salmon (Figure 6-41). The highest cancer risk estimates in whole-body samples occurred for spring chinook salmon followed, in decreasing order, by fall chinook salmon, coho salmon, walleye, and largescale sucker (Figure 6-42).

Figure 6-36. Excess cancer risk estimates for fillet samples of fish species collected at Site 56, Klickitat River

Figure 6-41. Excess cancer risk estimates for fillet samples of fish species collected at Site 30, Umatilla River

Figure 6-42. Excess cancer risk estimates for whole body samples of fish species collected at Site 30, Umatilla River

Fillet samples of one species were collected at Site 101, mountain whitefish. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration (Figure 6-43). Whole-body samples of two species were collected at this site, mountain whitefish and rainbow trout. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration. The highest cancer risk estimates in whole-body samples occurred for mountain whitefish followed by rainbow trout (Figure 6-44).

N.3.10 Grande Rhonde River

One sampling site was located in the Grande Rhonde River, site 94. One species was sampled at this site, spring chinook salmon. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except at the very lowest consumption rates with a 30-year exposure duration (Figure 6-45).

N.3.11 Snake River

Two sampling sites were located in the Snake River, 13 and 93. Fillet samples of two species were collected at site 13, largescale sucker and white sturgeon. Cancer risk estimates in fillet samples exceeded 1×10^{-6} at 30- and 70-year exposure durations. The highest cancer risk estimates occurred for white sturgeon followed by largescale sucker (Figure 6-46). Whole-body samples of one species, largescale sucker, were collected at site 13. Cancer risk estimates in whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration (Figure 6-47). One species was collected at Site 93, steelhead. Cancer risk estimates in fillet samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration. Cancer risk estimates in whole-body samples exceeded a cancer risk of 1×10^{-6} at 30- and 70-year exposure durations. Cancer risk estimates at site 93 were higher in fillet samples than in whole-body samples (Figure 6-48).

6.3.12 Clearwater River

One sampling site was located in the Clearwater River, site 96. One species was collected at this site, steelhead. Cancer risk estimates for fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations. Cancer risk estimates were higher in whole-body samples than fillet samples (Figure 6-49).

Figure 6-43. Excess cancer risk estimates for fillet samples of mountain whitefish collected at Site 101, Umatilla River

Figure 6-49. Excess cancer risk estimates for steelhead collected at Site 96, Clearwater River

6.3.13 Yakima River

Two sampling sites were located in the Yakima River, Site 48 and Site 49. Fillet samples of five species were collected at Site 48, fall chinook salmon, largescale sucker, mountain whitefish, spring chinook salmon, and steelhead. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration in spring chinook salmon, fall chinook salmon, and steelhead. The highest cancer risk estimates in fillet samples occurred for mountain whitefish followed, in decreasing order, by largescale sucker, spring chinook salmon, fall chinook salmon, and steelhead (Figure 6-50). Whole-body samples of six species were collected at Site 48, bridgelip sucker, fall chinook salmon, largescale sucker, mountain whitefish, spring chinook salmon, and steelhead. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration in fall chinook salmon and steelhead. The highest cancer risk estimates in whole-body samples occurred for mountain whitefish followed, in decreasing order, by largescale sucker, bridgelip sucker, spring chinook salmon, fall chinook salmon, and steelhead (Figure 6-51).

Two species were collected at Site 49, largescale sucker and rainbow trout. Cancer risk estimates in fillet and whole-body samples exceeded 1×10^{-6} at 30- and 70-year exposure durations, except for low consumption rates with a 30-year exposure duration in rainbow trout. The highest cancer risk estimates in fillet and whole-body samples occurred for largescale sucker followed by rainbow trout (Figures 6-52 and 6-53).

6.3.14 Wenatchee River

One sampling site was located in the Wenatchee River, site 51. One species was collected at this site, spring chinook salmon. Cancer risk estimates exceeded 1×10^{-6} at 30- and 70-year exposure durations, except at the lowest consumption rates with a 30-year exposure duration (Figure 6-54).

Appendix O**

**Summary of Risk Characterization Results
for Resident Species**

July 2002

**Prepared by
U.S. Environmental Protection Agency
Region 10
Seattle, Washington**

Appendix O - Summary of Risk Characterization Results for Resident Species

Six species of resident fish were sampled in the Columbia River basin: bridgelip sucker (*Catostomus columbianus*), largescale sucker (*Catostomus macrocheilus*), mountain whitefish (*Prosopium williamsoni*), white sturgeon (*Acipenser transmontanus*), walleye (*Stizostedion vitreum*), and rainbow trout (*Oncorhynchus mykiss*). These fish spend their entire life in freshwater in contrast to anadromous fish species which spend a portion of their lifecycle in the ocean. Specific life history traits for each species are discussed in Appendix B.

The following sections discuss the non-cancer health effects and cancer risk estimates associated with consuming resident fish species for both the general public and for Columbia River Basin Native American¹ populations. The methods used for this risk characterization were discussed in Sections 4 through 6 and a summary of the results are presented in Section 6.

Seventeen health endpoints were assessed for non-cancer health effects (Table 5-3). A total of 45 chemicals were used to generate the health endpoints ranging from one to 17 chemicals per health endpoint. A total hazard index for non-cancer health effects was also evaluated by summing the hazard quotients for individual chemicals. The 56 chemicals that have toxicity values for assessing cancer were evaluated by summing the cancer risk estimates for individual chemicals to determine a total excess cancer risk for two exposure durations: 30 years and 70 years.

Exposure parameters were selected to estimate cancer risk and non-cancer hazards to two target populations referred to as the general public and Columbia River Basin Native Americans (Native Americans) (see Section 4.1). Within each target population, cancer risks and non-cancer hazards were determined for adults, defined as individuals of age 18 or greater; non-cancer hazards were estimated for children, defined as up to age 15 years for the general public and up to age 6 years for Native Americans. Exposure parameters for adults and children differed for the rate of fish consumption, body weight, and exposure duration (Tables 4-1 and 4-2). A summary and discussion of the non-cancer hazards and excess cancer risks for these target populations are presented in this section by species. More detailed information on the risk characterization results are presented in the Appendices for each fish species and tissue type analyzed in this study and for several spatial scales: site, tributary (largescale sucker only), and basin:

1. All references to "Native Americans" and "tribes" in this report are only applicable to the CRITFC's member tribes: Confederated Tribes of Warm Springs, Yakama Nation, Umatilla Confederated Tribes, Nez Perce Tribe. They are collectively referred to as the CRITFC's member tribes.

- Appendix G1: Hazard quotients for individual chemicals for adults
- Appendix G2: Hazard quotients for individual chemicals for children
- Appendix H1: Percent contribution from individual chemicals to the total hazard index
- Appendix H2: Percent contribution from individual chemicals to endpoint-specific hazard indices
- Appendix I1: Estimated cancer risks for individual chemicals for adults, assuming 30 years exposure
- Appendix I2: Estimated cancer risks for individual chemicals for adults, assuming 70 years exposure
- Appendix J: Percent contribution of individual chemicals to total estimated cancer risk
- Appendix M: Comparison of the total and endpoint specific hazard indices across sites for a CRITFC's member tribal child (high fish consumption rate).
- Appendix N: Cancer risks across a range of consumption rates, by site and species

Appendix O-1 Bridgelip Sucker

Bridgelip sucker were collected from one site in the Columbia River Basin: 48, Yakima River. Chemical analyses were performed on one tissue type, whole body. The risk estimates characterized in this section were based on average chemical concentrations determined from the 3 replicate composite samples collected from Site 48. Because one site was sampled for bridgelip sucker, tributary and basin risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of whole body bridgelip sucker were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site. Table 1.1 shows the total hazard index for each of the populations evaluated in this risk assessment and the health endpoints which had hazard indices at or above 1.

Table 1.1 Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for bridgelip sucker collected from Site 48, Yakima River

NOTE: AFC - average fish consumption
HFC - high fish consumption

HI - hazard index
WB - whole body

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000b).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000b).

^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).

Up to six health endpoints exceeded a value of 1.0 in bridgelip sucker, depending on the target population and fish consumption rate used for calculation. The six endpoints were immune system, liver, central nervous system, reproduction/development, cardiovascular, and hyperpigmentation/keratosis, in decreasing order of toxicity.

Noncarcinogenic Chemicals With Hazard Quotients at or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in whole body samples of bridgelip sucker at Site 48 were identified and presented in Table 1.2. Hazard quotients for all detected chemicals are presented in Appendix G. A total of five individual chemicals were identified with hazard quotients at or above 1.0 in whole body samples of bridgelip sucker, total Aroclors, total DDT, mercury, manganese, and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Aroclor 1254 and Aroclor 1260 were the only Aroclors detected and used in the total Aroclor calculation.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Appendix I shows the cancer risk estimates for each carcinogenic chemical detected at each site. Total cancer risk estimates for bridgelip sucker are presented in Table 1.3.

Table 1.3 Total excess cancer risk for bridgelip sucker collected from Site 48, Yakima River

CONSUMPTION RATE/ EXPOSURE DURATION	TISSUE TYPE	TOTAL EXCESS CANCER RISK

HFC - high fish consumption

- ^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 7.5 g/day, or 1 8-oz meal per month (USEPA 2000b).
- ^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month (USEPA 2000b).
- ^c AFC risk based on average consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month (CRITFC 1994).

Carcinogenic Chemicals with Estimated Excess Cancer Risks At or Above 10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in bridgelip sucker with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 1.4.1 and 1.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

The chemicals with cancer risk estimates at or above 1×10^{-5} in whole body samples of bridgelip sucker at Site 48 were: adjusted Aroclors; PCBs 118, 126, and 156; 1,2,3,7,8-PeCDD; 2,3,7,8-TCDF; DDD, DDE and DDT; and arsenic.

Table 1.4 Chemicals with cancer risks at or above 1×10^{-5} for Columbia River Basin Native American population at average fish consumption and 70-year exposure in bridgelip sucker, whole body.

Bridgelip Sucker Whole Body		
	Chemical	Site 48
PCBs	Adjusted Aroclors	1E-04
	PCB 118	2E-05
	PCB 126	7E-05
	PCB 156	2E-05
Dioxin/furans	1,2,3,7,8-PeCDD	3E-05
	2,3,7,8-TCDF	1E-05
Pesticides	DDD	2E-05
	DDE	1E-04
	DDT	1E-05
Inorganic	Arsenic	4E-05
Total cancer risk		5E-04

NOTE: To estimate risk levels for general public AFC 30-year exposure, divide the cells in this table by 19.64.
 To estimate risk levels for general public HFC 30-year exposure, divide the cells in this table by 1.03.
 To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34.
 To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.
 To estimate risk levels for general public AFC 70-year exposure, divide the cells in this table by 8.43.
 To estimate risk levels for general public HFC 70-year exposure, divide the cells in this table by 0.44.
 To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.

AFC - average fish consumption

HFC - high fish consumption

Appendix O-2 Largescale Sucker

Largescale sucker were collected from seven sites in the Columbia River Basin: 8 and 9U, Columbia River; 13, Snake River; 30, Umatilla River; 48 and 49, Yakima River; and 98, Deschutes River. Chemical analyses were performed on two tissue types—fillet with skin and whole body—except for fish collected from Site 8, where only whole body samples were analyzed. The risk estimates characterized in this section are based on average chemical concentrations determined from three replicate composite samples collected from each site except for Sites 8, 30, and 48. At Site 8, two replicate composites were analyzed; at Site 30, four replicate composites were analyzed for fillet with skin samples; and at Site 48, six replicate composites were analyzed for whole body samples (Appendix A). Data are presented at three spatial scales: site, tributary, and basin. Largescale sucker was the only species collected at replicate sampling sites within a tributary, Site 48 and Site 49 in the Yakima River, and therefore, is the only fish species with tributary risk estimates.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet with skin and whole body largescale sucker were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site, Yakima River tributary, or basin. Samples were collected from two sites in the Yakima River, and, therefore, tributary risk was calculated for the Yakima River only. Table 2.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which exceeded a value of 1.0.

Table 2.1. Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for largescale sucker

- ^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000b).
- ^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam; 9U - located in the upper Columbia River above the Snake River; 98 - Deschutes River; 30 - Umatilla River; 13 - Snake River; 48 - Yakima River; 49 - Yakima River.
- ^f Tributary risk calculated for Site 48 and Site 49 in the Yakima River.

Up to ten health endpoints exceeded a value of 1.0, depending on the target population and exposure parameters used for calculation. The ten endpoints were immune system, central nervous system, reproduction/development, liver, metabolism, gastrointestinal, minimal neurotoxicity, kidney, cardiovascular, and hyperpigmentation/keratosis, in general decreasing order of toxicity based on basin averages in whole body samples, the tissue type where all ten health endpoints exceeded 1.0. Among specific sampling sites, total hazard indices were lowest at Site 98 in the Deschutes River for Fillet with skin samples and at Site 30 in the Umatilla River for whole body samples. Total hazard indices were highest at Site 48 in the Yakima River for fillet with skin samples and at two sites, 9U in the Columbia River and 48 in the Yakima River for whole body samples. Total hazard indices among sites varied by a factor of 4.8 for fillet with skin samples and 5.2 for whole body samples.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in fillet with skin samples of largescale sucker collected from six sites and in whole body samples of largescale sucker collected from seven sites were identified and presented in Table 2.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of four individual chemicals were identified with hazard quotients at or above 1.0 in fillet with skin samples of largescale sucker: total Aroclors, mercury, total DDT, and chromium, in decreasing order of toxicity based on the Native American child high fish consumption rate. A total of ten individual chemicals were identified in whole body samples of largescale sucker: total Aroclors, mercury, total DDT, nickel, cadmium, chromium, aluminum, manganese, zinc, and arsenic, in decreasing order of toxicity based on the Native American child high fish consumption rate. Aroclor 1254 and/or Aroclor 1260 were the only Aroclors detected and used in the total Aroclor calculation.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total excess cancer risk estimates are presented in Table 2.3 for each sampling site and for the tributary and basin averages.

Carcinogenic Chemicals with Estimated Excess Cancer Risks At or Above 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in largescale sucker with cancer risks at or above 1 x 10⁻⁵ are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 2.4.1 and 2.4.2). Multiplicative factors used to estimate risk at

different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

Adjusted Aroclors had the highest or second highest risk estimate at all sites in whole body samples and at all sites except Site 13 in fillet with skin samples where dibenz[a,h]anthracene had the highest risk estimate. Aroclor 1254 was the only individual Aroclor detected and used in the adjusted Aroclor calculation at Site 98 in fillet with skin and whole body samples. At Site 30, Aroclor 1260 was the only individual Aroclor detected and used in the adjusted Aroclor calculation in whole body samples. For all other sites with adjusted Aroclors greater than 10^{-5} , both Aroclors 1254 and 1260 were detected and used in the adjusted Aroclor calculation. At Site 48, DDE had the highest risk estimate for both tissue types. Of the PCB congeners, PCB 126 had the highest risk estimate for both tissue types at Site 98, and for fillet with skin samples at Site 9U. At Site 13, in fillet with skin samples, dibenz[a,h]anthracene, PCB 169, and benzo(a)pyrene, had risks greater than 10^{-5} and were not identified at any other sites.

Appendix O-3 Mountain Whitefish

Mountain whitefish were collected from four sites in the Columbia River Basin: 9U, Columbia River; 48, Yakima River; 98, Deschutes River; and 101, Umatilla River. Chemical analyses were performed on both fillet with skin and whole body tissue types. The cancer risk and non-cancer hazards in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site (Appendix A). Data are presented at two spatial scales: site and basin. Mountain whitefish were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet with skin and whole body mountain whitefish were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 3.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which are at or above a hazard index of 1.0.

Table 3.1 Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for mountain whitefish

site

FS - fillet with skin
WB - whole body

- ^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000b).
- ^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000b).
- ^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 9U - located in the upper Columbia River above the Snake River; 98 - Deschutes River; 101 - Umatilla River; 48 - Yakima River.

Up to seven health endpoints were at or above a value of 1.0, depending on the target population and exposure parameters used for calculation. The seven endpoints were immune system, liver, central nervous system, reproduction/development, selenosis, metabolism, and gastrointestinal in decreasing order of toxicity based on basin average total hazard indices of whole body samples. The immune system endpoint exceeded 1.0 for each target population and exposure scenario. The gastrointestinal health endpoint was unique to fillet with skin samples. Among specific sampling sites, total hazard indices for both fillet with skin and whole body samples were lowest at Site 101 in the Umatilla River and Site 98 in the Deschutes River and were generally an order of magnitude higher at Site 48 in the Yakima River and Site 9U in the Columbia River. Total hazard indices among sample sites varied by a factor of 17 in fillet with skin samples and by 5 in whole body samples.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in fillet with skin and whole body samples of mountain whitefish collected from four sites were identified and are presented in Table 3.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of four individual chemicals were identified with hazard quotients at or above 1.0 in fillet with skin samples of mountain whitefish: total Aroclors, total DDT, mercury, and selenium, in decreasing order of toxicity based on the Native American child, high fish ingestion rate. A total of five individual chemicals were identified with hazard quotients at or above 1.0 in whole body samples of mountain whitefish: total Aroclors, total DDT, mercury, selenium, and zinc, in decreasing order of toxicity based on the Native American child, high fish ingestion rate. Total Aroclors were comprised of Aroclor 1242, Aroclor 1254 and/or Aroclor 1260, depending on the sampling site.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 3.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated for mountain whitefish.

Carcinogenic Chemicals with Estimated Risks At or Above 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in whitefish with cancer risks at or above 1 x 10⁻⁵ are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 3.4.1 and 3.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

Adjusted Aroclors had the highest or second highest risk estimate for all sites and tissue types. Adjusted Aroclors were composed of different Aroclors at each site: 1254 and 1260 at Site 48; 1254 at Site 98; 1260 at Site 101; and 1242, 1254, and 1260 at Site 9U. PCB 126 had the highest risk estimate for both tissue types at Site 98, and for fillet with skin samples at Site 9U. The remaining chemicals varied among sites and tissue types.

NOTE: A blank indicates that this chemical does not have a cancer risk greater than 1×10^{-5} for this tissue type at this site.

To estimate risk levels for general public AFC 30-year exposure, divide the cells in this table by 19.64.

To estimate risk levels for general public HFC 30-year exposure, divide the cells in this table by 1.03.

To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34.

To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.

To estimate risk levels for general public AFC 70-year exposure, divide the cells in this table by 8.43.

To estimate risk levels for general public HFC 70-year exposure, divide the cells in this table by 0.44.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.

AFC = average fish consumption

HFC = high fish consumption

^a Site - Waterbody: 9U - located in the upper Columbia River above the Snake River; 48 - Yakima River; 98 - Deschutes River; 101 - Umatilla River.

Appendix O-4 White Sturgeon

White sturgeon were collected from six sites in the Columbia River Basin: 6, 7, 8, 9L, and 9U in the Columbia River and Site 13 in the Snake River. Chemical analyses were performed on two tissue types, fillet without skin and whole body. Fillet without skin samples were analyzed for each of the six sampling sites; whole body samples were analyzed for sites 8, 9L, and 9U. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site except for Site 9U, which had 1 composite for fillet without skin samples and 5 replicate composites for whole body samples, and for Site 13, which had 4 replicate composites for fillet without skin samples (Appendix A). Data are presented at two spatial scales: site and basin. White sturgeon were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet without skin and whole body white sturgeon were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 4.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which had hazard indices at or above 1.0.

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000b).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000b).

^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).

- * Site - Waterbody: 6 - located in the Columbia River between the Bonneville Dam and the Dalles Dam; 7 - located in the Columbia River between the Dalles Dam and the John Day Dam; 8 - located in the Columbia River between the John Day Dam and the McNary Dam; 9L - located in the upper Columbia River below the Snake River; 9U, located in the upper Columbia River above the Snake River; 13 - Snake River.

Up to eight health endpoints exceeded a value of 1.0 for white sturgeon depending on the target population and exposure parameters used for calculations. The eight endpoints were immune system, liver, central nervous system, reproduction/development, selenosis, cardiovascular, hyperpigmentation/keratosis, and gastrointestinal in decreasing order of toxicity based on basin average total hazard indices of whole body samples. Among specific sampling sites, total hazard indices were generally lowest at Site 7 and Site 8 for fillet without skin samples and Site 9L for whole body samples. Total hazard indices were highest at Site 9U for fillet without skin samples and at Site 8 for whole body samples. Total indices among sites varied by a factor of 5.2 for fillet with skin samples and by 1.5 for whole body samples.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 collected from six sites in fillet without skin samples of white sturgeon and from three sites in whole body samples were identified and shown in Table 4.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of four individual chemicals were identified with hazard quotients at or above 1.0 in fillet without skin samples of white sturgeon: total Aroclors, mercury, total DDT, and selenium, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of six individual chemicals were identified with hazard quotients at or above 1.0 in whole body samples of white sturgeon: total Aroclors, total DDT, mercury, arsenic, chromium, and selenium, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 and Aroclor 1260, depending on the sampling site.

Cancer Risks Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 4.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated.

Carcinogenic Chemicals with Estimated Risks At or Above 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in white sturgeon with cancer risks at or above 1 x 10⁻⁵ are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 4.4.1 and 4.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment

The same three chemicals were identified as having the highest cancer risk for all sites and tissue types for white sturgeon: 2,3,7,8-TCDF, adjusted Aroclors, and DDE. The highest risk estimate of the three chemicals varied among sites, although 2,3,7,8-TCDF was the highest for most of the fillet without skin samples. Aroclors 1254 and 1260 were the only

individual Aroclors detected and used in the adjusted Aroclor calculation for all sites and tissue types.

^a Site - Waterbody: 6 - located in the Columbia River between the Bonneville Dam and the Dalles Dam; 7 - located in the Columbia River between the Dalles Dam and the John Day Dam; 8 - located in the Columbia River between the John Day Dam and the McNary Dam; 9U, located in the upper Columbia River above the Snake River; 9L - located in the upper Columbia River below the Snake River; 13 - Snake River.

Appendix O-5 Walleye

Walleye were collected from two sites in the Columbia River Basin: 7, Columbia River and 30, Umatilla River. Chemical analyses were performed on two tissue types, fillet with skin and whole body, except for fish collected from Site 7 where only whole body samples were analyzed. The risk estimates characterized in this section are based on average chemical concentrations determined from two replicate composite samples collected from Site 7 and three replicate composite samples collected from Site 30 for fillet with skin samples and one composite sample for whole body samples at Site 30 (Appendix A). Data are presented at two spatial scales: site and basin. Walleye were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet with skin and whole body walleye were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals

with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 5.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which were at or above a hazard index of 1.0.

- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 7 - located in the Columbia River between the Dalles Dam and the John Day Dam; 30 - Umatilla River
- ^f Basin average hazard indices equals Site 30 for FS samples.

Up to seven health endpoints exceeded a value of 1.0 for walleye depending on the target population and exposure parameters used for calculations. The seven endpoints were immune system, central nervous system, reproduction/development, liver, cardiovascular, hyperpigmentation/keratosis, and selenosis in decreasing order of toxicity based on basin average hazard indices. For whole body samples, which were collected at both Site 7 and Site 30, total hazard indices varied by a factor of 3.1 between sites.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in fillet with skin samples of walleye collected from Site 7 and Site 30 and in whole body samples collected from Site 30 were identified and are shown in Table 5.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of five individual chemicals were identified as having hazard quotients at or above 1.0 in fillet with skin samples of walleye: mercury, total Aroclors, thallium, arsenic, and total DDT, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of five individual chemicals were identified as having hazard quotients at or above 1.0 in whole body

samples of walleye: total Aroclors, mercury, total DDT, arsenic, and selenium, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in fillet with skin samples and Aroclor 1254 and Aroclor 1260 in whole body samples.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for

detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 5.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated.

Carcinogenic Chemicals with Estimated Risks At or Above 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in walleye with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 5.4.1 and 5.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment

Five chemicals have risks at or above 1×10^{-5} in whole body samples at site 7: adjusted Aroclors, PCBs 118, 126 and 156, and DDE. Adjusted Aroclors had the highest risk estimate for whole body samples at Site 7. Whole body and fillet with skin samples at site 30 had no risks above 1×10^{-5} . Aroclors 1254 and 1260 were the only individual Aroclors detected and used in the adjusted Aroclor calculation for all sites and tissue types. Aroclor 1260 was not detected in fillet with skin samples at Site 30. Arsenic had the highest risk estimate for both tissue types at Site 30.

A blank indicates that this chemical does not have an estimated cancer risk at or above 10^{-5} for this site and tissue type.

To estimate risk levels for general public AFC 30-year exposure, divide the cells in this table by 19.64.

To estimate risk levels for general public HFC 30-year exposure, divide the cells in this table by 1.03.

To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34.

To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.

To estimate risk levels for general public AFC 70-year exposure, divide the cells in this table by 8.43.

To estimate risk levels for general public HFC 70-year exposure, divide the cells in this table by 0.44.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.

* Site - Waterbody: 7 - located in the Columbia River between the Dalles Dam and the John Day Dam;

30 - Umatilla River.

Appendix O-6 Rainbow Trout

Rainbow trout were collected from four sites in the Columbia River Basin: 56, Klickitat River; 98, Deschutes River; 101, Umatilla River; and 49, Yakima River. Chemical analyses were performed on two tissue types, fillet with skin and whole body, except at Site 56 and Site 101 where only whole body samples were analyzed. The risk estimates characterized in this section are based on average chemical concentrations determined from 2–4 replicate composite samples. Two replicate composites were analyzed for whole body samples at Site 56, three replicate composites for fillet with skin and whole body

samples at Site 49 and for whole body samples at Site 98, and four replicate composites for fillet with skin samples at Site 98 and Site 101 (Appendix A). Data are presented at two spatial scales: site and basin. Rainbow trout were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet with skin and whole body rainbow trout were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 6.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which were at or above a hazard index of 1.0.

- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 49 - Yakima River; 56 - Klickitat River; 98 - Deschutes River; 101 - Umatilla River.

Up to eight health endpoints exceeded a value of 1.0 for rainbow trout depending on the target population and exposure parameters used for calculations. The eight endpoints were immune system, central nervous system, reproduction/development, liver, metabolism, selenosis, cardiovascular, and hyperpigmentation/keratosis in decreasing order of toxicity based on basin average hazard indices in whole body samples. Hazard indices were consistently highest at Site 98 in the Deschutes River, and generally lowest at Site 101 in the Umatilla River. Total hazard indices varied among sites by a factor of 1.2 in fillet with skin samples and by 1.9 in whole body samples.

Chemicals with Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in fillet with skin samples of rainbow trout collected from Site 49 and Site 98 and in whole body samples collected from Sites 49, 56, 98, and 101 were identified and are shown in Table 6.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of three

individual chemicals were identified as having hazard quotient at or above 1.0 in fillet with skin samples of rainbow trout: mercury, total Aroclors and total DDT, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of five individual chemicals were identified with hazard quotients at or above 1.0 in whole body samples: mercury, total Aroclors, total DDT, arsenic, and zinc, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in fillet with skin samples and Aroclor 1254 and Aroclor 1260 in whole body samples, depending on the sampling site.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 6.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated.

Carcinogenic Chemicals with Estimated Risks at or Above 10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in rainbow trout with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risks for all chemicals are also shown (Tables 6.4.1 and 6.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment

The three chemicals with excess cancer risks at or above 1×10^{-5} were identified for each tissue type and for each site. Seven chemicals had risk at or above 1×10^{-5} for rainbow trout fillet: adjusted Aroclors, PCB 126, PCB 118, PCB 156, DDE, 2,3,7,8-TCDD, and 1,2,3,7,8-PeCDD. In addition to these seven chemicals, arsenic and PCB 105 have risk at or above 10^{-5} in whole body samples. PCB 126 had the highest risk estimate for all sites and tissue types except whole body samples at Site 56, for which arsenic was highest.

Adjusted Aroclors had the second or third highest risk estimate for all sites and tissue types except whole body samples at Site 49. Aroclor 1254 was the only individual Aroclor detected and used in the adjusted Aroclor calculation for all sites and tissue types except for whole body samples at Site 101, for which only Aroclor 1260 was detected and used.

**COLUMBIA RIVER BASIN FISH
CONTAMINANT SURVEY**

**VOLUME 1
Appendix P**

**Summary of Risk Characterization Results
for Anadromous Species**

July 2002

**Prepared by
U.S. Environmental Protection Agency
Region 10
Seattle, Washington**

Appendix P - Summary of Risk Characterization Results for Anadromous Species

Six anadromous fish were sampled in the Columbia River Basin: coho salmon (*Oncorhynchus kisutch*), fall chinook salmon (*Oncorhynchus tshawytscha*), spring chinook salmon (*Oncorhynchus tshawytscha*), steelhead (*Oncorhynchus mykiss*), eulachon (*Thaleichthys pacificus*), and Pacific lamprey (*Lampetra tridentata*). These fish spend a portion of their lifecycle in the ocean. Specific life history traits for each species are discussed in Appendix B.

The following sections discuss the non-cancer health effects and cancer risk estimates associated with consuming anadromous fish species for both the general public and for Columbia River Basin Native American¹ populations using the exposure assumptions presented in Section 4.0. Non-cancer health effects and cancer risks for resident species were summarized in Appendix O.

The methods used for this risk characterization were discussed in Sections 4 through 6 and a summary of the results are presented in Section 6. The risk characterization results shown for eggs in this Appendix are not discussed in Section 6, however, due to the uncertainty in egg consumption rates. A discussion of the risk characterization results for eggs are presented in Section 10.5 of the Uncertainty Evaluation.

Seventeen health endpoints were assessed for non-cancer health effects (Table 5-3). A total of 45 chemicals were used to generate the health endpoints ranging from one to 17 chemicals per health endpoint. A total hazard index for non-cancer health effects was also evaluated by summing the hazard quotients for individual chemicals. The 56 chemicals that have toxicity values for assessing cancer were evaluated by summing the cancer risk estimates for individual chemicals to determine a total cancer risk for two exposure durations for adults: 30 years and 70 years.

Exposure parameters were selected to estimate cancer risk and non-cancer hazards to two target populations referred to as the general public and Columbia River Basin Native Americans (Native Americans) (see Section 4.1). Within each target population, cancer risk and non-cancer hazards estimates were determined for adults, defined as individuals of age 18 or greater; non-cancer hazards were estimated for children, defined as up to age 15 years for the general public and up to age 6 years for Native Americans. Exposure parameters for adults and children differed for the fish consumption rate, body weight, and exposure duration (Tables 4-1 and 4-2). A summary and discussion of the non-cancer hazards and cancer risk estimates for these target populations are presented in this section by species. More detailed information on the risk characterization results are presented in the Appendices for each fish species and tissue type analyzed in this study and for several spatial scales: site, tributary (largescale sucker only), and basin:

1. All references to "Native Americans" and "tribes" in this report are only applicable to the CRITFC's member tribes: Confederated Tribes of Warm Springs, Yakama Nation, Umatilla Confederated Tribes, Nez Perce Tribe. They are collectively referred to as the CRITFC's member tribes.

Appendix P-1 Coho Salmon

Coho salmon were collected from one site in the Columbia River Basin: 30, Umatilla River. Chemical analyses were performed on egg, fillet with skin, and whole body tissue types. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from Site 30 (Appendix A). Because one site was sampled for coho salmon, tributary and basin risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of egg, fillet with skin, and whole body coho salmon were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site. Table 1.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which had hazard indices at or above 1.0.

Table 1.1 Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for coho salmon. Collected from Site 30, Umatilla River

- ^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000).
- ^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000).
- ^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).

Up to seven health endpoints exceeded a value of 1.0, depending on the target population and exposure parameters used for the calculations. The seven health endpoints were immune system, central nervous system, reproduction/development, cardiovascular, hyperpigmentation/keratosis, liver, and metabolism in decreasing order of toxicity based on hazard indices of whole body samples.

Chemicals With Hazard Quotients At or Above 1.0.

Individual chemicals with a hazard quotient at or greater than 1.0 in egg, fillet with skin, and whole body samples of coho salmon collected from Site 30 were identified and are shown in Table 1.2. Hazard quotients for other individual chemicals are presented in Appendix G. One chemical was identified with an hazard quotient greater than 1.0 in egg samples of coho salmon, total Aroclors. A total of three individual chemicals with hazard quotients at or above 1.0 were identified in fillet with skin samples of coho salmon: total Aroclors, mercury, and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. In whole body samples, a total of four individual chemicals were identified at or above 1.0: total Aroclors, mercury, arsenic, and zinc, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in egg samples and Aroclor 1254 and Aroclor 1260 in fillet with skin and whole body samples.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals are presented in Appendix I. Total cancer risk estimates are presented in Table 1.3. Sampling sites were not replicated and, therefore, tributary and basin risk were not calculated for coho salmon.

Carcinogenic Chemicals with Estimated Cancer Risks At or Above 10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in coho salmon fillet with skin or whole body samples with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risks for all chemicals are also shown (Tables 1.4.1 and 1.4.2). Multiplicative factors used to estimate risk at

different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

A total of four chemicals were identified as having cancer risks at or above 1×10^{-5} for coho salmon: arsenic, adjusted Aroclors, PCB 126, and PCB 118. Arsenic had the highest risk estimate for all tissue types. Adjusted Aroclors had the second highest risk estimate for all tissue types. The individual Aroclors detected and used in the adjusted Aroclor calculation were Aroclor 1254 for egg samples, and Aroclors 1260 and 1254 for fillet with skin and whole body samples. PCB 126 had the third highest risk estimate for fillet with skin and whole body samples, but was not detected in eggs. PCB 118 had the third highest risk estimate for egg samples.

Appendix P-2 Fall Chinook Salmon

Fall chinook salmon were collected from five sites in the Columbia River Basin: 8 and 14, Columbia River; 30, Umatilla River; 48, Yakima River; and 56, Klickitat River. Chemical analyses were performed on egg, fillet with skin, and whole body tissue types. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site except for egg samples at Site 8 which had 1 composite sample and fillet with skin samples at Site 8 and Site 14, which each had 4 replicate composites (Appendix A). Data are presented in two spatial scales: site and basin. Fall chinook salmon were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of egg, fillet with skin, and whole body fall chinook salmon were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 2.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which were at or above a hazard index of 1.0.

- ^e Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam, 14 - located in the upper Columbia River above the Snake River; 30 - Umatilla River; 48 - Yakima River; 56 - Klickitat River.

Up to eight health endpoints had hazard indices at or above 1.0, depending on the target population and exposure parameters used for calculation. The eight health endpoints were immune system, central nervous system, reproduction/development, cardiovascular, hyperpigmentation/keratosis, liver, selenosis, and metabolism, in decreasing order of toxicity based on basin average hazard indices of whole body samples. Among specific sampling sites, total hazard indices for both fillet with skin and whole body samples were lowest at Site 56 in the Klickitat River and were generally two to three times higher at Site 14 in the Columbia River. Total hazard indices among sample sites varied by a factor of 2.6 in fillet with skin samples and by 1.7 in whole body samples.

Chemicals With Hazard Quotients At or Above 1.0

The individual chemicals with a hazard quotient at or above 1.0 in fillet with skin and whole body fall chinook samples from five sites are identified in Table 2.2. No hazard quotients were above 1.0 for eggs. The hazard quotients for all individual chemicals are presented in Appendix G. A total of three individual chemicals were identified with hazard quotients at or above 1.0 in

fillet with skin samples of fall chinook salmon: total Aroclors, mercury, and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of six individual chemicals were at or above 1.0 in whole body samples of fall chinook salmon: total Aroclors, mercury, arsenic, copper, selenium, and zinc, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in fillet with skin and whole body samples.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 2.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated for fall chinook salmon.

Table 2.3 Total cancer risks for fall chinook salmon

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 7.5 g/day, or 1 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month (USEPA 2000).

^c AFC risk based on average consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month (CRITFC 1994).

^e Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam, 14 - located in the upper Columbia River above the Snake River; 30 - Umatilla River; 48 - Yakima River; 56 - Klickitat River.

Chemicals with Estimated Cancer Risks At or Above 1×10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in fall chinook salmon fillet with skin or whole body samples with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risks for all chemicals are also shown (Tables 2.4.1 and 2.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

A total of five chemicals were found at risk levels at or above 1×10^{-5} for fall chinook salmon, depending on sampling site: arsenic, adjusted Aroclors, PCB 126, PCB 118, and 2,3,7,8-TCDF. Arsenic had the highest risk estimate for all sites and tissue types. Adjusted Aroclors had the second or third highest risk estimate for all sites and tissue types. Aroclor 1254 was the only individual Aroclor detected and used in the adjusted Aroclor calculation.

Total Cancer Risk for All Chemicals**2E-04****2E-04****1E-04****2E-04****2E-04**

NOTE: A blank indicates that this chemical does not have a cancer risk at or above 1×10^{-5} for this tissue type at this site

To estimate risk levels for general public AFC 30-year exposure, divide the cells in this table by 19.64.

To estimate risk levels for general public HFC 30-year exposure, divide the cells in this table by 1.03.

To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34.

To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.

To estimate risk levels for general public AFC 70-year exposure, divide the cells in this table by 8.43.

To estimate risk levels for general public HFC 70-year exposure, divide the cells in this table by 0.44.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.

^a Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam, 14 - located in the upper Columbia River above the Snake River; 30 - Umatilla River ; 48 - Yakima River; 56 - Klickitat River.

Appendix P-3 Spring Chinook Salmon

Spring chinook salmon were collected from eight sites in the Columbia River Basin: 21, Willamette River; 30, Umatilla River; 48, Yakima River; 51, Wenatchee River; 56, Klickitat River; 62, Little White Salmon River; 63, Wind River; and 94, Grande Ronde River. Chemical analyses were performed on egg, fillet with skin, and whole body tissue types. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site (Appendix A). Data are presented at two spatial scales: site and basin. Spring chinook salmon were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of egg, fillet with skin, and whole body spring chinook salmon were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 3.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints at or above a hazard index of 1.0.

Table 3.1. Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for spring chinook salmon

- NOTE: AFC - average fish consumption na - not applicable; sample type not analyzed at this site E - eggs
HFC - high fish consumption -- indicates health endpoint <1.0 at that site FS - fillet with skin
HI - hazard index WB - whole body
- ^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000).
- ^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000).
- ^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 21 - Willamette River; 30 - Umatilla River; 48 - Yakima River; 51 - Wenatchee River; 56 - Klickitat River; 62 - Little White Salmon River; 63 - Wind River; 94 - Grande Ronde River.

A total of ten health endpoints exceeded a hazard index of 1.0 depending on the target population and exposure parameters used for the calculation. The ten health endpoints were immune system, central nervous system, reproduction/development, cardiovascular, hyperpigmentation/keratosis, liver, kidney, metabolism, selenosis, and gastrointestinal in decreasing order of toxicity based on basin average hazard indices. Among specific sampling sites, total hazard indices for both fillet with skin and whole body samples were lowest at Site 21 in the Willamette River and 1.6 to three times higher at Site 56 in the Klickitat River.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in egg samples of spring chinook salmon and in fillet with skin and whole body samples of spring chinook salmon were identified and are presented in Table 3.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of two individual chemicals were identified as having hazard quotients at or above 1.0 in egg samples of spring chinook salmon: total Aroclors and selenium. A total of four individual chemicals were identified with hazard quotients above 1.0 in fillet with skin samples of spring chinook salmon: mercury, total Aroclors, arsenic, and chromium, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of seven individual chemicals were identified with hazard quotients above 1.0 in whole body samples of spring chinook salmon: total Aroclors, mercury, arsenic, chromium, cadmium, selenium, and zinc, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in egg, fillet with skin, and whole body samples.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are

presented in Table 3.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated for spring chinook salmon.

Table 3.3. Total cancer risks for spring chinook salmon

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 7.5 g/day, or 1 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month (USEPA 2000).

^c AFC risk based on average consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month (CRITFC 1994).

^e Site - Waterbody: 21 - Willamette River; 30 - Umatilla River; 48 - Yakima River; 51 - Wenatchee River; 56 - Klickitat River; 62 - Little White Salmon River; 63 - Wind River; 94 - Grande Rhonde River.

Carcinogenic Chemicals with Estimated Cancer Risks At or Above 1 X 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in spring chinook (fillet with skin and in whole body samples) with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Tables 3.4.1 and 3.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

A total of seven chemicals were identified with risks at or above 1×10^{-5} for spring chinook salmon, depending on sampling site: arsenic, adjusted Aroclors, PCB 126, PCB 118, 2,3,7,8-TCDF, 1,2,3,7,8-PeCDD, and 2,3,4,7,8-PeCDF. Arsenic had the highest risk estimate for all sites and tissue types. Adjusted Aroclors had the second or third highest risk estimate for all sites and tissue types. Aroclor 1254 was the only individual Aroclor detected and used in the adjusted Aroclor calculation.

Table 3.4.1. Chemicals with cancer risks at or above 1×10^{-5} for Columbia River Basin Native American population at average fish consumption and 70-year exposure duration in spring chinook salmon, whole body

NOTE: A blank indicates that this chemical is not at or above a cancer risk of 1×10^{-5} for this tissue type at this site

To estimate risk levels for general population AFC 30-year exposure, divide the cells in this table by 19.64.

To estimate risk levels for general population HFC 30-year exposure, divide the cells in this table by 1.03

To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34

To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.

To estimate risk levels for general population AFC 70-year exposure, divide the cells in this table by 8.43

To estimate risk levels for general population HFC 70-year exposure, divide the cells in this table by 0.44.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16

^a Site - Waterbody: 21 - Willamette River; 30 - Umatilla River; 48 - Yakima River; 51 - Wenatchee River; 56 - Klickitat River; 62 - Little White Salmon River; 63 - Wind River; 94 - Grande Ronde River.

Appendix P-4 Steelhead

Steelhead were collected from six sites in the Columbia River Basin: 8, Columbia River; 25, Hood River; 48, Yakima River; 56, Klickitat River; 93, Snake River; and 96, Clearwater River. Chemical analyses were performed on egg, fillet with skin, and whole body tissue types. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site except at Site 8 for egg samples, which had one composite sample, and in fillet with skin and whole body samples, which had 6 replicate composite samples each (Appendix A). Data are presented in two spatial scales: site and basin. Steelhead were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of eggs, fillet with skin, and whole body steelhead were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 4.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints that were at or above a hazard index of 1.0.

Table 4.1. Total hazard indices and noncarcinogenic health endpoints at or above 1.0 for steelhead

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000).

^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).

^e Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam; 25 - Hood River; 48 - Yakima River; 56 - Klickitat River; 93 - Snake River; 96 - Clearwater River.

P-26

both fillet with skin and whole body samples were lowest at Site 8 in the Columbia River and were generally two times higher in fillet with skin samples at Site 25 and in whole body samples at Site 96. Total hazard index risk estimates among sample sites varied by a factor of 1.7 in fillet with skin samples and 2.2 in whole body samples (Table 6-47).

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in egg samples of steelhead in fillet with skin and whole body samples of steelhead were identified and are presented in Table 4.2. Hazard quotients for other individual chemicals are presented in Appendix G. A total of two individual chemicals had hazard quotients above 1.0 in egg samples of steelhead, selenium and total Aroclors, based on the Native American child, average fish consumption rate. A total of three individual chemicals had hazard quotients greater than 1.0 in fillet with skin samples of steelhead: mercury, total Aroclors, and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of seven individual chemicals were identified with hazard quotients above 1.0 in whole body samples of steelhead: mercury, total Aroclors, arsenic, nickel, selenium, copper, and total DDT, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in egg samples and Aroclor 1254 and 1260 in fillet with skin and whole body samples.

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemicals at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 4.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated for fall chinook salmon.

Carcinogenic Chemicals with Estimated Risks At or Above 10⁻⁵

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in steelhead (fillet with skin and in whole body samples) with cancer risks at or above 1 x 10⁻⁵ are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risks for all chemicals are also shown (Tables 4.4.1 and 4.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

A total of four chemicals were at or above 1 x 10⁻⁵ for steelhead, depending on sampling site: arsenic, adjusted Aroclors, PCB 126, and PCB 118. In fillet with skin samples, arsenic was the highest at most sites, except for Site 93 and Site 96 where PCB 126 had the highest risk estimates. Adjusted Aroclors was the second or third highest risk estimate for fillet with skin samples at all sites. In whole body samples, arsenic had the highest risk estimate at Sites 8, 56, and 25; PCB 126 had the highest risk estimate at Site 93 and Site 96; adjusted Aroclors had the highest risk estimate at Site 48. Aroclor 1254 was detected and used in the adjusted Aroclor calculation for all sites and tissue types. Aroclor 1260 was also detected and used at Site 25 and Site 48 for fillet with skin and whole body samples.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16

^a Site - Waterbody: 8 - located in the Columbia River between the John Day Dam and the McNary Dam;
25 - Hood River; 48 - Yakima River; 56 - Klickitat River; 93 - Snake River; 96 - Clearwater River.

Appendix P-5 Eulachon

Eulachon were collected from one site in the Columbia River Basin: 3, located in the Columbia River. Chemical analyses were performed on whole body tissue. The risk estimates characterized in this section are based on average chemical concentrations determined from the three replicate composite samples collected from Site 48. One site was sampled for eulachon and, therefore, tributary and basin risk averages were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of whole body eulachon were assessed by calculating hazard quotients for all detected chemicals with oral reference doses (Appendix G). The hazard quotients of chemicals with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site. Table P-5.1 shows the total hazard index for each of the populations evaluated in this risk assessment and the health endpoints that had hazard indices at or above of 1.0.

Table 5.1. Total hazard indices and noncarcinogenic health endpoints with hazard indices at or above 1.0 for eulachon collected from Site 3, Columbia River

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000).

^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).

^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).

Up to two health endpoints exceeded a hazard index of 1.0, depending on the target population and exposure parameters used for calculation. The two endpoints were cardiovascular and hyperpigmentation/keratosis.

Chemicals With Hazard Quotients At or Above 1.0.

Individual chemicals with a hazard quotient greater than 1.0 in whole body samples of eulachon at Site 3 were identified and are presented in Table 5.2. Hazard quotients for all individual chemicals are presented in Appendix G. One chemical, arsenic, had a hazard quotient above 1.0 in whole body samples of eulachon at the Native American adult and child, high fish consumption rates.

Carcinogenic Chemicals with Estimated Risks At or Above 10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals in eulachon whole body samples with cancer risks at or above 1×10^{-5} are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risk for all chemicals are also shown (Table 5.4). Multiplicative factors used to estimate risks at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

Only three chemicals had cancer risks above 1×10^{-5} for eulachon: arsenic, 2,3,7,8-TCDD, and 1,2,3,7,8-PeCDD.

Table 5.4. Chemicals with cancer risks at or above 1×10^{-5} for Columbia River Basin Native American population at average fish consumption and 70-year exposure duration in eulachon, whole body collected at Site 3, Columbia River

To estimate risk levels for general population HFC 70-year exposure, divide the cells in this table by 0.44.

To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.

Appendix P-6 Pacific Lamprey

Pacific lamprey were collected from two sites in the Columbia River Basin: 21, Willamette River and 24, Fifteen Mile Creek. Chemical analyses were performed on fillet with skin and whole body samples of fish collected from Site 21 and on whole body samples of fish collected from Site 24. The risk estimates characterized in this section are based on average chemical concentrations determined from 3 replicate composite samples collected from each site except for whole body samples at Site 21, which had 6 replicate composite samples (Appendix A). Data are presented at two spatial scales: site and basin. Pacific lamprey were not collected from replicate sampling sites within a tributary and, therefore, tributary risk estimates were not calculated.

Noncarcinogenic Health Effects

The potential noncarcinogenic health effects associated with the consumption of fillet with skin and whole body Pacific lamprey were assessed by calculating hazard quotients for all detected chemicals with a oral reference dose (Appendix G). The hazard quotients with the same health endpoint were summed to calculate endpoint-specific hazard indices. In addition, the hazard quotients of all detected chemicals were summed to calculate a total hazard index for the site or basin. Table 6.1 shows the total hazard index for each of the target populations evaluated in this risk assessment and the health endpoints which exceeded a value of 1.0.

HI - hazard index

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public (adult) of 7.5 g/day, or 1 8-oz meal per month, and for general public (child) of 2.83 g/day, or 0.4 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month, and for general public (child) of 77.95 g/day, or 11 8-oz meals per month (USEPA 2000).

^c AFC risk based on average consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month, and for child fish consumers of 24.8 g/day, or 3 8-oz meals per month (CRITFC 1994).

- ^d HFC risk based on 99th percentile consumption rate for adult fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month, and for child fish consumers of 162 g/day, or 22 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 21 - Willamette River ; 24 - Fifteen Mile Creek
- ^f Basin average hazard indices equals Site 21 hazard indices for FS samples.

Up to eight health endpoints exceeded a hazard index of 1.0 depending on the target population and exposure parameters used for calculation. The eight health endpoints were immune system, central nervous system, reproduction/development, liver, kidney, selenosis, cardiovascular, and hyperpigmentation/keratosis in decreasing order of toxicity based on basin average hazard indices of whole body samples.

Chemicals With Hazard Quotients At or Above 1.0

Individual chemicals with a hazard quotient at or above 1.0 in fillet with skin samples of Pacific lamprey at Site 21 and in whole body samples at Sites 21 and 24 are shown in Table 6.2. Hazard quotients for all chemicals are presented in Appendix G. A total of three individual chemicals had hazard quotients above 1.0 in fillet with skin samples of Pacific lamprey: total Aroclors, total DDT, and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. A total of eight individual chemicals had hazard quotients at or above 1.0 in whole body samples of Pacific lamprey: total Aroclors, mercury, total DDT, copper, cadmium, selenium, chlordane (total), and arsenic, in decreasing order of toxicity based on the Native American child, high fish consumption rate. Total Aroclors were comprised of Aroclor 1254 in fillet with skin samples and Aroclor 1254 and Aroclor 1260 in whole body samples.

Table 6.2. Chemicals having hazard quotients at or above 1.0 in Pacific lamprey

^b HFC only

Cancer Risk Estimates

Cancer risks were estimated for general public and Columbia River Basin Native American adults at both 30- and 70-year exposure durations. Cancer risk estimates for detected carcinogenic chemical at each sampling site are presented in Appendix I. Total cancer risk estimates are presented in Table 6.3 for each sampling site and for the basin average. Sampling sites were not replicated within a tributary and, therefore, tributary risk estimates were not calculated for Pacific lamprey.

Table 6-3. Total cancer risk for Pacific lamprey

CONSUMPTION RATE/ EXPOSURE DURATION	TISSUE TYPE	TOTAL EXCESS CANCER RISK		
		SITE ^a		BASIN AVERAGE
		21	24	
General Public^{a,b}				
AFC/30-yr	FS	3x10 ⁻⁵	na	3x10 ⁻⁵

NOTE: AFC - average fish consumption
HFC - high fish consumption

FS - fillet with skin
WB - whole body

na - not applicable; sample type not analyzed at this site

^a AFC risk based on average U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 7.5 g/day, or 1 8-oz meal per month (USEPA 2000).

^b HFC risk based on 99th percentile U.S. per capita consumption rate of uncooked freshwater and estuarine fish for general public of 142.4 g/day, or 19 8-oz meals per month (USEPA 2000).

- ^c AFC risk based on average consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 63.2 g/day, or 9 8-oz meals per month (CRITFC 1994).
- ^d HFC risk based on 99th percentile consumption rate for fish consumers in the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin of 389 g/day, or 53 8-oz meals per month (CRITFC 1994).
- ^e Site - Waterbody: 21 - Willamette River ; 24 - Fifteen Mile Creek.

Chemicals with Estimated Risks At or Above 10^{-5}

Cancer risk estimates vary across populations, consumption rates, and exposure levels by constant factors. Chemicals with estimated cancer risks at or above 1×10^{-5} in Pacific lamprey fillet with skin and in whole body samples are shown for the Columbia River Basin Native American population with average fish consumption rates at a 70-year exposure duration; total cancer risks for all chemicals are also shown (Tables 6.4.1 and 6.4.2). Multiplicative factors used to estimate risk at different exposure parameters and target populations are footnoted in the table. In addition, Appendix I shows individual risk estimates for each detected chemical for all the exposure scenarios used in this risk assessment.

A total of 12 chemicals had cancer risks at or above 1×10^{-5} in whole body Pacific lamprey: adjusted Aroclors, PCB 105, PCB 114, PCB 118, PCB 126, 1,2,3,7,8-PeCDD, 2,3,7,8-TCDD, arsenic, total chlordane, hexachlorobenzene, and DDE. Fillet with skin had 11 chemicals with estimated risks at or above 1×10^{-5} - all those for whole body except PCB 114. PCB 126 had the highest risk estimate for both sites and tissue types. Adjusted Aroclors had the second highest risk estimate for both sites and tissue types. The individual Aroclors detected and used in the adjusted Aroclor calculation were Aroclor 1254 for whole body samples at Site 24 and fillet with skin samples at Site 21 and Aroclors 1260 and 1254 for whole body samples at Site 21. Arsenic had the third highest risk for whole body samples at Site 21. PCB 118 had the third highest risk for whole body samples at Site 24 and fillet with skin samples at Site 21.

Table 6.4.1. Chemicals with cancer risks at or above 1×10^{-5} for Columbia River Basin Native American population at average fish consumption and 70-year exposure duration in Pacific lamprey, whole body

Total Cancer Risk for All Chemicals		6E-04

NOTE: A blank indicates that this chemical does not have a cancer risk at or above 1×10^{-6} for this tissue type at this site.

To estimate risk levels for general population AFC 30-year exposure, divide the cells in this table by 19.64.
To estimate risk levels for general population HFC 30-year exposure, divide the cells in this table by 1.03.
To estimate risk levels for Native American AFC 30-year exposure, divide the cells in this table by 2.34.
To estimate risk levels for Native American HFC 30-year exposure, divide the cells in this table by 0.38.
To estimate risk levels for general population AFC 70-year exposure, divide the cells in this table by 8.43.
To estimate risk levels for general population HFC 70-year exposure, divide the cells in this table by 0.44.
To estimate risk levels for Native American AFC 70-year exposure, divide the cells in this table by 0.16.
