

Projection factors and results by sector to produce inventories used in air quality modeling

These spreadsheets provide the projection and control factors used to develop the 2016v3 year 2023 emissions for sectors that were projected using factors, along with non-EGU sources that were determined to have closed by the analytical year. Summaries of the impacts of the factors are included. The types of factors include projection factors and control factors.

Note: projection factors and results are not available for sectors for which emissions based on the output of models like EGUs, onroad and nonroad.

The following spreadsheets of factors are provided:

2023gf_nonpoint_projection_factors.xlsx: projection factors for the sectors area fugitive dust, commercial marine vessels, agricultural livestock, nonpoint oil and gas, other nonpoint, solvents, and residential wood combustion

2023gf_point_projection_factors.xlsx: point closures and projection factors for airports, point oil and gas, and other non-EGU point sources.

2023gf_controls.xlsx: control factors for point and nonpoint sectors including non-EGU point sources, nonpoint sources, and solvents.
