

AB2588 SOURCE TEST REPORT

PACIFIC ENERGY SYSTEMS  
6055 E. Washington Blvd.  
Commerce, CA 90040

ATTENTION: Mr. Terence Hee

UNIT TESTED:

Oxnard Landfill  
Prior Internal Combustion Engine #2

DATE TESTED:

July 23 thru July 27, 1990

DATE REPORTED:

October 24, 1990

EMISSIONS DETERMINATION OF:

CARB Method 429: PAH  
CARB Method 430: Formaldehyde  
Method 436: As, Be, Cd, Cr, Cu, Pb, Mg, Hg, Ni, Se, Zn  
CARB Method 423: As  
Method 425: Total Chrome/Hexavalent Chromium  
CARB Method 421: HCL  
CARB Method 13B: HFL

Report: 62-232

Tested by: JEM  
Jim Marchesini

Reviewed by: JEM

# INTRODUCTION

## INTRODUCTION

At the request of Pacific Energy Systems, Petro Chem Environmental Services (PCES) performed a series of source tests on one Superior internal combustion engine. The unit is located at the Oxnard Landfill and uses landfill gas as fuel. The purpose of the testing was to document emissions of various pollutants to satisfy the requirements for the State of California AB2588, Air Toxics "Hot Spots" Information and Assessment Act of 1987. The following tests were performed:

| <u>Pollutant</u>         | <u>Date</u>   | <u>Method</u> | <u>No. Runs</u> |
|--------------------------|---------------|---------------|-----------------|
| PAH                      | 7/24,25,26,90 | CARB 429      | 3 + Blank       |
| Formaldehyde             | 7/27/90       | CARB 430      | 3 + Blank       |
| As,Be,Cd,Cr,Cv,Pb,Mn,Hg, | 7/24,27/90    | CARB 436      | 3 + Blank       |
| Ni,Se,Zn                 | 7/24,27/90    | CARB 423      | 3 + Blank       |
| As                       | 7/25/90       | CARB 425      | 3 + Blank       |
| Cr,Crt6                  | 7/26/90       | CARB 421      | 3 + Blank       |
| HCL                      | 7/23/90       | EPA 13B       | 3 + Blank       |
| HFL                      |               |               |                 |

The samples were analyzed by the following laboratories:

| <u>Test Method</u> | <u>Analytical Laboratory</u>                 |
|--------------------|----------------------------------------------|
| CARB 429           | Triangle Laboratories of Texas               |
| CARB 430           | Coast to Coast Analytical of San Luis Obispo |
| CARB 436           | Enesco Labs of Garden Grove                  |
| CARB 423           | Enesco Labs of Garden Grove                  |
| CARB 425           | Enesco Labs of Garden Grove                  |
| CARB 421           | Enesco Labs of Garden Grove                  |
| EPA 13B            | Zalco Labs of Bakersfield                    |

All sampling was conducted by Mr. John Nylin of Petro Chem Environmental Services. Mr. James Marchesini supervised all testing and performed all testing equipment turnaround and method recovery procedures. Mr. Dennis Marsh of Pacific Energy Systems supervised all testing.

## DISCUSSION

## DISCUSSION

The testing of Pacific Energy System's Superior engine located at the Oxnard Landfill began on July 23, and continued through July 27, 1990. All testing proceeded smoothly without any upsets due to testing equipment or engine operational problems. All testing was conducted upstream of the exhaust outlet. Two sample ports were placed on the same cross sectional plane 90 degrees apart, approximately five diameters downstream and two diameters upstream from disturbance in flow.

Prior to testing a cyclonic flow check was conducted and showed an average angle of deviation of five degrees from sixteen traverse points.

Metals emissions were determined by sampling the inlet fuel gas and outlet exhaust gas. Fuel gas consumption rates were documented to determine the units inlet metals rate. CARB Method 436 was used to determine metals exhaust emission rate.

All methods consisted of sixteen point traverses from two ports (eight points/port) and sampled for one hour. The exception was for the CARB 429 testing which consisted of three-three hour runs.

## METHOD 429 PAH

### METHOD 429 SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to condenser line, XAD-2 resin trap and four modified Greenburg Smith impingers containing 100 ml DI H<sub>2</sub>O, 100 ml DI H<sub>2</sub>O dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, chromic acid, distilled water, methanol toluene, and methylene chloride. All sample containers were pre-cleaned by rinsing with methanol toluene and methylene chloride. Soapy water, tap, chromic acid, distilled water, methanol, toluene, methylene chloride.

The sample train was charged, a pre-cleaned Whatman QMA Quartz fiber filter was placed into the filter holder and the probe/nozzle/filter was put together and all sampling equipment was sealed with hexane rinsed foil and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Triplicate test runs were performed. All lasting 180 minutes.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled and the components were then sealed with aluminum hexane rinsed foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 429 SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with methylene toluene and methylene chloride and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle, and filter top half were then similarly cleaned and the rinsings were combined with the probe wash. The filter was removed from the filter holder with teflon coated forceps, folded and wrapped in hexane rinsed foil, placed into a petri dish and sealed with teflon tape.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers cross overs and filter bottom half were rinsed three times with methanol toluene and methylene chloride, and the rinses were combined with the impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

### CARB METHOD 430: FORMALDEHYDE

The sampling apparatus consisted of a heated stainless steel probe, followed by three midget impingers containing 15 ml of acidified DNPH in the first two and silica gel in the third. The impinger train was connected to a vacuum pump/rotometer/dry gas meter assembly. Prior to the test the impingers were cleaned with chromic acid, distilled water, methylene chloride, methanol, and oven dried. The impinger bottoms were sent to the analytical laboratory for charging. The impinger bottoms were charged, capped and returned to PCES for sampling within a 48 hour period of making the DNPH solution.

### CARB METHOD 430: SAMPLING:

The charged impinger bottoms were stored in a friction top can with 1-2 inches of a activated charcoal and shipped to the sample location. The impingers were uncapped, the impinger tops added and then the sampling train was assembled. The train was transported to the stack, and leak tested by closing the teflon stopcock at the first impinger while applying the vacuum to the system. The stopcock was then opened and sampling proceeded at a sample rate of 1.0lpm. (.035 ft/min). Upon completion of the test the train was leak tested again, and a 5 ml distilled water probe wash was performed and allowed to drain into the first impinger. The train was then disconnected from the probe and lowed down to the mobile laboratory the impinger tops were removed, impingers capped and sealed with teflon tape labeled, and placed back into the friction top can with activated charcoal. The samples were then shipped back to the analytical laboratory for extraction and analysis of formaldehyde by CARB Method 430, HPLC.

A field blank was similarly treated but, instead of sampling stack gas zero grade nitrogen was flushed through the impingers. A 5 ml distilled water aliquot was added to the first impinger to represent a probe wash. A sample spike was performed by the analytical laboratory and that impinger was transported to the sample location where it remained for the duration of a test run. The sample spike was then sent back to the analytical laboratory along with the other samples for analysis.

METHOD 436: MULTIMETALS  
Cr, Cd, As, Ni, Mn, Be, Cu, Zn, Pb, Se, P, Ti, Ag, Sb, Ba, Hg

METHOD 436 SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to impinger line and six modified Greenburg Smith impingers containing 100 ml 5% HNO<sub>3</sub>, 10% H<sub>2</sub>O<sub>2</sub>, 100 ml 5% HNO<sub>3</sub>, 10% H<sub>2</sub>O<sub>2</sub> dry, 100 ml Acidified KMnO<sub>4</sub>, 100 ml Acidified KMnO<sub>4</sub> dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, 6N HNO<sub>3</sub> soak, and distilled H<sub>2</sub>O. All sample containers were pre-cleaned by rinsing with 6N HNO<sub>3</sub> rinse and distilled H<sub>2</sub>O.

The sample train was charged, a Whatman QMA Quartz fiber filter was placed into the filter holder and the probe/nozzle/ filter was put together and all sampling equipment was sealed and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled the filter to impinger line was rinsed with a known amount of 0.1N HNO<sub>3</sub> into the first impinger, and the components were then sealed with aluminum foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 436 SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with Acetone and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle and filter top half were then similarly cleaned and the rinsings were combined with the probe wash. The afore mentioned procedure was repeated with 0.1N HNO<sub>3</sub> and placed into a second rinse jar. The filter was removed from the filter holder with teflon coated forceps, folded and placed into a petri dish.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers and cross overs were rinsed three times with 0.1N HNO<sub>3</sub>, and the rinses were combined with the impingate sample.

The forth and fifth impingers were disassembled, weighted, and their contents transferred to amber sample bottles. The impingers were then rinsed three times with Acidified KMnO<sub>4</sub>, 8N HCL, and combined with impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

METHOD 436 SAMPLE ANALYSIS:

For each test five samples are generated for analysis. Method 436 protocol details the analysis of metals using cold vapor atomic absorption, inductively coupled Argon plasma emission spectroscopy (ICAP), and Graphite furnace atomic absorption (GFAAS).

The reagent blanks were similarly analyzed and an in-house spike was performed with a similar sample matrix, percent recoveries are reported.

### METHOD 423: ARSENIC (As)

#### METHOD 423 SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to impinger line and four modified Greenburg Smith impingers containing 100 ml DI Distilled H<sub>2</sub>O, 100 ml DI Distilled H<sub>2</sub>O dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, 6N HNO<sub>3</sub> soak, distilled H<sub>2</sub>O, and 0.1N NaOH. All sample containers were pre-cleaned by rinsing with 6N HNO<sub>3</sub> rinse and distilled H<sub>2</sub>O and 0.1N NaOH.

The sample train was charged, a Whatman QMA Quartz fiber filter was placed into the filter holder and the probe/nozzle/filter was put together and all sampling equipment was sealed and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled the filter to impinger line was rinsed with a known amount of 0.1N NaOH into the first impinger, and the components were then sealed with aluminum foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 423 SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with 0.1N NaOH and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle, and filter top half were then similarly cleaned and the rinsings were combined with the probe wash. The filter was removed from the filter holder with teflon coated forceps, folded and placed into a petri dish.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers cross overs and filter bottom half were rinsed three times with 0.1N NaOH, and the rinses were combined with the impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

**METHOD 423 SAMPLE ANALYSIS:**

The filter was digested and combined with the probe wash and impingate contents. The sample was then analyzed for Arsenic by Hydride atomic absorption (CARB 423).

The reagent blanks were similarly analyzed and an in-house spike was performed with a similar sample matrix, percent recoveries are reported.

METHOD 425: HEXAVALENT CHROMIUM (Cr+6)  
AND TOTAL CHROMIUM (Cr)

METHOD 425 SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to impinger line and four modified Greenburg Smith impingers containing 100 ml DI distilled H<sub>2</sub>O, 100 ml DI distilled H<sub>2</sub>O, dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, 6N HNO<sub>3</sub> soak, and distilled H<sub>2</sub>O. All sample containers were pre-cleaned by rinsing with 6N HNO<sub>3</sub> rinse and distilled H<sub>2</sub>O.

The sample train was charged, a teflon coated glass fiber filter was placed into the filter holder and the probe/nozzle/filter was put together and all sampling equipment was sealed and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled the filter to impinger line was rinsed with a known amount of DI Distilled H<sub>2</sub>O into the first impinger, and the components were then sealed with aluminum foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 425 SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with DI Distilled H<sub>2</sub>O and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle and filter top half were then similarly cleaned and the rinsings were combined with the probe wash. The filter was removed from the filter holder with teflon coated forceps, folded and placed into a petri dish.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers cross overs and filter bottom half were rinsed three times with DI Distilled H<sub>2</sub>O, and the rinses were combined with the impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

METHOD 425 SAMPLE ANALYSIS:

The probe/nozzle rinse was analyzed separately. The filter was digested and combined with the probe wash and impingate contents. A portion of the sample was analyzed for Hexavalent Chromium by the Diphenylcarbazide calorimetric method. The remainder of the sample was analyzed for total Chromium by atomic absorption.

The reagent blanks were similarly analyzed and an in-house spike was performed with a similar sample matrix, percent recoveries are reported.

## METHOD 421: HYDROCHLORIC ACID (HCL)

### METHOD 421 SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to impinger line and four modified Greenburg Smith impingers containing 100 ml sodium bicarbonate/sodium carbonate solution, 100 ml sodium bicarbonate/sodium carbonate solution, dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, and distilled H<sub>2</sub>O. All sample containers were pre-cleaned by rinsing with sodium bicarbonate/sodium carbonate solution rinse and distilled H<sub>2</sub>O.

The sample train was charged, a Whatman QMA Quartz fiber filter was placed into the filter holder and the probe/nozzle/filter was put together and all sampling equipment was sealed and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled the filter to impinger line was rinsed with a known amount of sodium bicarbonate/sodium carbonate solution into the first impinger, and the components were then sealed with aluminum foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 421 SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with sodium bicarbonate/sodium carbonate solution and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle and filter top half were then similarly cleaned and the rinsings were combined with the probe wash. The filter was removed from the filter holder with teflon coated forceps, folded and placed into a petri dish.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers cross overs and filter bottom half were rinsed three times with sodium bicarbonate/sodium carbonate solution, and the rinses were combined with the impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

METHOD 421 SAMPLE ANALYSIS:

The filter was digested and combined with the probe wash and impingate contents. The sample was analyzed for Chloride by ion chromatography conductivity detection.

The reagent blanks were similarly analyzed and an in-house spike was performed with a similar sample matrix, percent recoveries are reported.

### METHOD 13B: FLUORIDE

#### METHOD 13B SAMPLING:

The sampling apparatus is the same as that which is described for EPA Method #5 and consisted of a quartz nozzle, heat traced quartz probe, borosilicate filter holder with a teflon-coated screen filter support, a teflon filter to impinger line and four modified Greenburg Smith impingers containing 100 ml DI H<sub>2</sub>O, 100 ml DI H<sub>2</sub>O dry and silica gel.

Prior to the testing all sampling equipment was cleaned with successive rinses of soapy water, tap water, and distilled H<sub>2</sub>O. All sample containers were pre-cleaned by rinsing with 6N HNO<sub>3</sub> rinse and distilled H<sub>2</sub>O.

The sample train was charged, a Whatman filter was placed into the filter holder and installed between the 3rd and 4th impinger. The probe/nozzle bypass was put together and all sampling equipment was sealed and transported to the stack for assembly.

The sampling equipment was assembled and leak tested at 10 inches Hg vacuum. The probe and filter components were heated to 250 + or - 25 degrees F. The probe was inserted into the stack and isokinetic sampling was initiated as per EPA Method #5.

Upon completion of a test the probe was withdrawn from the stack and leak tested at a vacuum equal to or greater than the maximum vacuum observed during the test. The equipment was then disassembled the filter to impinger line was rinsed with a known amount of 0.1N NaOH into the first impinger, and the components were then sealed with aluminum foil and transported to the mobile laboratory for sample recovery.

A field blank was similarly treated: charged, transported to the stack, leak tested, disassembled, and transported to the mobile laboratory for sample recovery. No additional gases were pulled through the field blank train.

#### METHOD 13B SAMPLE RECOVERY:

The filter and nozzle were separated from the probe. The probe was tilted and brushed three successive times while rinsing with DI H<sub>2</sub>O and rotating. Sterile surgical gloves were used during this process. All rinses were caught in an amber glass sample bottle. The nozzle was then similarly cleaned and the rinsings were combined with the probe wash. The filter was removed from the filter holder with teflon coated forceps, folded and placed into a petri dish.

The first, second and third impingers were disassembled, weighed, and their contents transferred to an amber sample bottle. The impingers cross overs and filter bottom half were rinsed three times with DI H<sub>2</sub>O, and the rinses were combined with the impingate sample.

Aliquots of the reagents grade chemicals and filters were recovered for analysis as reagent blanks. All samples were sealed, fluid levels marked, labeled and logged on a chain of custody form. Upon completion of the test they were transported to the laboratory for analysis.

## FIELD DATA

Pac. F. 1019 Report #: \_\_\_\_\_  
 Client: \_\_\_\_\_  
 Location: 0 Yngd #2 \_\_\_\_\_  
 Operator: JDN/JFM \_\_\_\_\_  
 Date: 7-25-90 \_\_\_\_\_  
 Run No: 2 (cont'd) \_\_\_\_\_  
 Pump No.: 6-54 \_\_\_\_\_  
 Meter Box No.: 1002 \_\_\_\_\_  
 Meter  $\Delta$  H @: .90 \_\_\_\_\_  
 Pitot Tube No.: 30-2 \_\_\_\_\_

Post Test Leak Chk.

Leak Rate: 0.12 cfm  
Vacuum: 2.5 (in. Hg)

Ambient Temp: 75°F  
Barometric Pressure: 30.37  
Static Pressure, (in Hg): 21  
Assumed Moisture %: 13  
Nozzle Ident. No.: \_\_\_\_\_  
Aver. Calib. Nozzle Diam.(in): 1.19  
Probe Liner Material: quartz  
Filter Number: \_\_\_\_\_  
Duct Diam. (in): 17.5

**CASE NARRATIVE**  
**TRIANGLE LABORATORIES OF HOUSTON, INC.**  
12823 PARK ONE DRIVE  
SUGAR LAND, TX 77478  
(713) 240-5330

**DATE:** October 23, 1990

**TLH PROJECT NO:** TLH #158

**OBJECTIVE:** Determination of polyaromatic hydrocarbons (PAHs) in MM5 trains.

**METHOD**

Method: California Air Resources Board Method 429 (CARB 429) adopted September 12, 1989.

**PAH Extraction and Cleanup:**

A modification of CARB 429 was approved to permit analysis of a single pooled extract from all sample containers. An alternate standard (d<sub>10</sub>-anthracene) was spiked into impinger water in the separatory funnel just prior to extraction. The impinger extract was combined with XAD-2 resin from the trap in a Soxhlet extraction apparatus. Following addition of internal standards, the soxhlet extraction was performed in the manner prescribed in CARB 429. The deuterated standards were spiked at 50 and 100 µg levels.

Following extraction, the samples were brought to 25 ml final volume with methylene chloride and stored in the dark at 4°C. A 0.5 ml sample portion was combined with a 0.5 ml portion of the recovery standard and submitted to GC-MS for final analysis.

**GC/MS**

High resolution gas chromatography and high resolution mass spectrometry (HRGC/HRMS) were used for analysis of the sample extracts.

The calibration range for PAH extracts was from 0.1 - 5.0 ng/µl. For diluted samples the calibration range represents 5 - 250 µg per train.

The GC-MS analysis conditions are listed below:

GC CONDITIONS:

|                 |                                                                       |
|-----------------|-----------------------------------------------------------------------|
| GC:             | HP5890                                                                |
| Column:         | 60m x 0.25mm DB-5                                                     |
| Injector:       | Splitless, 30 sec. valve time, 300°C                                  |
| Interface Temp: | 300°C                                                                 |
| Program:        | 125°C for 5.5 min then 10°/min<br>to 300°C final temperature and hold |

MS INSTRUMENT:

Selected Ion Recording Mode

See Table 1 for PAH ions monitored

Total cycle time for SIR mode was less than 1 sec/cycle

Resolving power: 5000 (10% valley definition)

REPORT

The report is divided into the following sections:

1. Sample Documentation
2. Sample Data
3. Calibration Data

These sections provide all available information for complete sample tracking and sample review, including quality assurance evaluations.

1. Sample Documentation: This section provides information on sample tracking and handling during shipment, receiving and processing. Included are the chain-of-custody and log-in instrument sheets.

2. Sample Data: This section contains tabulated results along with raw data that is useful for data review and quality assurance or for reconstructing the results. Included in this section is the following information:

- a. Quantitation Report
- b. Interim Report
- c. Chromatograms

Quantitation Report: The quantitation report is headed by the filename, Client ID and TLH sample number, sample ID and project number, sample size and matrix, CONCAL and ICAL information, spike file used for the calculations, and further shipment information. An internal alternate and surrogate standard recovery summary containing the following information is found at the end of the report:

Concentration  
% recovery  
Retention times and flags

Interim Report: The interim report is headed by the analogous sample information and filenames of the pertinent calibration data. It provides tabulated raw data (retention times, areas) along with ion ratios and recoveries.

Chromatograms: Mass Chromatograms corresponding to the ions monitored for each analyte and each standard and instrument performance monitoring compound (PFK), are included for each sample. Each trace is headed by information corresponding to the mass being monitored.

3. Calibration Data: The calibration data are presented for the daily calibration (CCAL) as well as the initial calibration (ICAL). The performance check solution (PCS) runs that precede any type of calibration procedure and conclude a 12-hour run period are also included.

The calibration data are used to establish the valid range for quantitation, and to verify analyte identification criteria. They are reported as:

- a. Calibration Check
- b. Chromatograms

Calibration Check: Calculated response factors, retention time data, as well as the percent difference are presented in the CONCAL summary.

The ICAL summary provides information on response factors over the calibration range, along with the variance in data as determined by the percent relative standard deviation.

Chromatograms: Mass Chromatograms and areas of integrated peaks corresponding to the standards present in the calibration solutions are included. This data can be used to reconstruct the calculated RF, %D, %RSD, RT, RRT, and ratio results.

## RESULTS AND DISCUSSION

A summary of the results is presented below:

PAH ANALYSIS  
(Values listed in ng)

ND = not detected

Standard solution spiking.

The following standards were spiked at 50,000 ng:

d8-Naph, d10-2-Me-Naph, d7-2-Cl-Naph, d8-Acenaph, d10-Acenaph then, d10-Fluorene, d10-Phenan, d10-Fluoran, d10-Pyrene, d12-B-a-Anth, d12-Chrysene, d10-Anth, d14-Terphenyl.

The following standards were spiked at 100,000 ng:

d12-B-b-Fluoran, d12-B-k-Fluoran, d12-B-a-Pyrene, d12-Perylene, d12-I-123-cd-Py, d14-DiB-ah-Anth, d12-B-ghi-Pery, d12-B-e-Pyrene.

The method blank showed the presence of 77  $\mu\text{g}$  Naphthalene. This is attributed to contaminants known to exist in the XAD-2 resin.

The sample labeled "Blank" shows the presence of 18.5  $\mu\text{g}$  of Naphthalene and small amounts of 2-Methyl-Naphthalene.

Samples Run 1, Run 2, Run 3, and Run 4 were found to contain Naphthalene quantities ranging from 47 to 102  $\mu\text{g}$  of Naphthalene, and other PAHs in smaller quantities.

The method blank and the samples show good recoveries that are within the QC advisory limit with the exception of the following: sample Run 1 shows recoveries for d8-Acenaphthylene and d12-Perylene that are below the QC advisory limit, and sample Run 3 shows recovery for d8-Acenaphthylene that is also below the QC advisory limit. Based on signal-to-noise ratios that far exceed the proposed 10:1 limit, these recoveries are considered acceptable. No quantities of the corresponding analytes were detected in the two samples.

Pump No.:

Meter Box No.: 1002 Factor:

Meter  $\Delta H$  @:           .900          

Pitot Tube No.: 30-1

Post Test Leak Chk.

Leak Rate: \_\_\_\_\_ cfm

Vacuum: \_\_\_\_\_ (in Hg)

Ambient Temp: 75°F

Barometric Pressure: 30.35Static Pressure, (in Hg): 2.0Assumed Moisture %: 13

Nozzle Ident. No.:

Aver. Calib. Nozzle Diam.(in): .19

Probe Liner Material: - Quartz

Filter Number:

Duct Diam. (in): 13.5

\* Values reported are lower detection limit

PACIFIC ENERGY INLET METALS CALCULATIONS mg Metal/kg Fuel Consumed:

$$\frac{\text{mg}}{\text{Liter}} * \frac{\text{Sample Volume (mls)}}{\frac{1000 \text{ ml}}{1 \text{ Liter}}} = \text{Total mg Metal}$$

$$\text{Test Duration 90 minutes} * 630 \frac{\text{SCF}}{\text{minute}} = 56,700 \text{ Total Fuel Consumed}$$

$$\frac{56,700 \text{ cf}}{13.63 \frac{\text{cu.ft}}{\text{lb}}} = 4,159.94 \text{ lbs of Fuel Consumed}$$

$$4,159.94 \text{ lbs Fuel} * .45359 \frac{\text{Kgs}}{\text{lb}} = 1886.91 \text{ Kgs Fuel Consumed}$$

FOR ARSENIC:

$$\frac{8.40 * 10^{-3} \text{ Arsenic mgs}}{1886.91 \text{ Kgs Fuel}} = 4.45 * 10^{-6} \frac{\text{mg Arsenic}}{1 \text{ Kg Fuel}}$$

# APSC 423 FIELD DATA

Client: PACIFIC ENERGY Report #:                       
 Location: QUAND UNIT #2  
 Operator: NEW JPN  
 Date: 7-24-90  
 Run No: 1 CONT  
 Pump No.: 61A5T  
 Meter Box No.: 1002 Factor:                       
 Meter  $\Delta H$  @: .90  
 Pitot Tube No.: 3Q-1

Post Test Leak Chk.                     

Leak Rate: 4.001 cfm  
 Vacuum: 10 (in Hg)

Ambient Temp: 30.25  
 Barometric Pressure: 30.25  
 Static Pressure, (in Hg): 42.1  
 Assumed Moisture %: 13 MW = 27.5  
 Nozzle Ident. No.:                       
 Aver. Calib. Nozzle Diam. (in): .18  
 Probe Liner Material: Q1A112  
 Filter Number: 182 QF  
 Duct Diam. (in): 17.5

Arsonic - 3

FIELD DATA

Client: Pac. Envsy Report #: \_\_\_\_\_  
 Location: Oxnard #2  
 Operator: TDN/JEM  
 Date: 7-77-90  
 Run No: 3  
 Pump No.: 9454  
 Meter Box No.: 1002 Factor: \_\_\_\_\_  
 Meter  $\Delta$  H @: .900  
 Pitot Tube No.: 30-1

Post Test Leak Chk.

Leak Rate: \_\_\_\_\_ cfm  
Vacuum: \_\_\_\_\_ (in Hg)

Ambient Temp: 75 +  
 Barometric Pressure: 30.35  
 Static Pressure, (in Hg): 2.0  
 Assumed Moisture %: 13.0 mW<sub>w</sub>H = 77.5  
 Nozzle Ident. No.: \_\_\_\_\_  
 Aver. Calib. Nozzle Diam.(in): .190  
 Probe Liner Material: quartz  
 Filter Number: QT 184  
 Duct Diam. (in): 17.5

CI Data No. 425 FIELD DATA

Client: PAUL J. JONES Report #: \_\_\_\_\_  
Location: \_\_\_\_\_  
Operator: JAN JDN  
Date: 7-25-93  
Run No: 2 CNT  
Pump No.: 5 CNT  
Meter Box No.: 1002 Factor: \_\_\_\_\_  
Meter  $\Delta$  H @: .90  
Pitot Tube No.: 30-7

Post Test Leak Chk.

Ambient Temp: \_\_\_\_\_  
Barometric Pressure: 30.34  
Static Pressure, (in Hg): 2.1  
Assumed Moisture %: 13 mwt 27.5  
Nozzle Ident. No.: \_\_\_\_\_  
Aver. Calib. Nozzle Diam.(in): .14  
Probe Liner Material: Q1/AlTR  
Filter Number: \_\_\_\_\_  
Duct Diam. (in): 17.5

Leak Rate: 6.00 cfm  
Vacuum: 10 (in Hg)

CLIMATE 1425 FIELD DATA

Client: PACIFIC ENERGY Report #: \_\_\_\_\_  
 Location: OXNARD VALLEY #12  
 Operator: JEN JDN  
 Date: 7-25-93  
 Run No: 3 GUNT  
 Pump No.: 6331  
 Meter Box No.: 1032 Factor: \_\_\_\_\_  
 Meter  $\Delta H$  @: -50  
 Pitot Tube No.: 30-1

Post Test Leak Chk.  
 Leak Rate: \_\_\_\_\_ cfm  
 Vacuum: \_\_\_\_\_ (in Hg)

Ambient Temp: \_\_\_\_\_  
 Barometric Pressure: 30.34  
 Static Pressure, (in Hg): 2.1  
 Assumed Moisture %: 13 MW = 22.5  
 Nozzle Ident. No.: \_\_\_\_\_  
 Aver. Calib. Nozzle Diam.(in): .19  
 Probe Liner Material: -GAS T2  
 Filter Number: \_\_\_\_\_  
 Duct Diam. (in): 7.5

ATTN: MR. TIM BRENNAN

Analysis No.: G-9021915-001/008  
Date Sampled: 24-JUL-1990  
Date Sample Rec'd: 7-AUG-1990  
Project: (232) PACIFIC ENERGY SYSTEMS  
OXNARD ICE #2

Enclosed with this letter is the report on the chemical and physical analyses on the samples from ANALYSIS NO: G-9021915-001/008 shown above.

The samples were received by CRL in a chilled state, intact and with the chain-of-custody record attached.

Note that ND() means not detected at the reporting limit expressed within the parentheses. The detection limit is the reporting limit raised to reflect the dilution factor of the sample.

FIELD DATA

Client: Pac. Fin. 54 Report #: \_\_\_\_\_

Post Test Leak Chk.

Ambient Temp: 75.0

Location: Grand #2  
Operator: FCN / S.M

Leak Rate: \_\_\_\_\_ cfm  
Vacuum: \_\_\_\_\_ (in Hg)Barometric Pressure: 30Static Pressure, (in Hg): 7.0

Assumed Moisture %: 12

Nozzle Ident. No.:

Aver. Calib. Nozzle Diam.(in): .19

Probe Liner Material: - 9 V.C.G. + 1

Filter Number:                     

Duct Diam. (in): 17.5
