DISCLAIMER

This report is intended for use solely by the Rubber Manufacturers Association for the specific purposes described in the contractual documents between TRC Environmental Corporation and the Rubber Manufacturers Association. All professional services performed and reports generated by TRC have been prepared for the Rubber Manufacturers Association's purposes as described in the contract. The information, statements and conclusions contained in the report have been prepared in accordance with the work statement and contract terms and conditions. The report may be subject to differing interpretations and/or may be misinterpreted by third persons or entities who were not involved in the investigative or consultation process. TRC Environmental Corporation therefore expressly disclaims any liability to persons other than the Rubber Manufacturers Association who may use or rely upon this report in any way or for any purpose.

DEVELOPMENT OF EMISSION FACTORS FOR THE RUBBER MANUFACTURING INDUSTRY

OVERVIEW

The contributions of the members of the Environment Committee of the Rubber Manufacturers Association in the preparation of this document are hereby gratefully acknowledged.

The Rubber Manufacturers Association is a cooperative manufacturing trade association with more than 150 member companies. While RMA member companies are bound together by a common denominator—basic raw materials—the membership embraces several industries with often dissimilar problems. For this reason, the services of the RMA are organized into five business groups including: General Products, Information and Statistics, Public Affairs, Technical and Standards, and Finance and Administration. The goals of these groups are to: 1) serve as a forum for exchange of information with and among member companies on issues of common concern, and in areas of common interest; 2) provide a single voice for the industry in dealing with its publics, including government, consumers, and the general public; 3) monitor, recommend and promote the industry viewpoints on legislative and regulatory issues of concern, and investigate and report on the potential impact of these issues on the rubber industry; 4) coordinate formulation of industry positions on domestic and international standards; and 5) establish and maintain close working relationships with other organizations which share common interests and concerns.

SECTION 1

INTRODUCTION

1.1 Program Overview and Objectives

On July 21, 1992, EPA promulgated the Operating Permit Rule (*"The Title V Operating Permit Rule"*, Federal Register, July 21, 1992), which represents an expanded and very different approach to permitting air emission sources. The operating permit program commonly referred to as *Title V* is a national program which is now being implemented on a state by state (and in the case of California, county by county) basis. In other words, each state has been charged with developing and implementing a federally enforceable operating permit program which meets or exceeds the Clean Air Act Amendment (CAAA) requirements.

Title V now requires each facility which exceeds major source thresholds to secure a facility wide permit. The Title V program defines major source applicability on the basis of **potential to emit**, or, PTE. All facilities which have the potential to emit more than any of the following must secure a facility operating permit:

- 100 tons/year of a criteria pollutant except in selected urban areas where the threshold can be as low as 10 tons/year
- 10 tons/year of a single HAP or 25 tons/year in aggregate of any listed HAPs

To prepare a facility Title V permit, there are several tasks which must be completed. One such activity is the development of the plant emissions inventory which is the largest part of the permitting effort and also one of the areas where accuracy is critical. An inaccurate inventory can result in future compliance problems.

The key to producing an accurate inventory is contingent upon the availability of sound emissions data or emission factors for each process in a facility. These factors coupled with commonly archived process and production data are used to calculate emissions and produce the inventory.

As a result of the lack of documented emissions factors for the rubber manufacturers industry, the Rubber Manufacturers Association (RMA), on behalf of its membership, embarked on a large project to address the emission factor issue. Specifically, the objectives of the project were as follows:

- Develop emission factors for the commonly used rubber manufacturing processes;
- Develop a consistent applications approach for developing plant-wide emissions inventories;
- Develop a standard protocol for estimating emissions related to future process changes;

- Provide background information for addressing Title V record keeping and compliance demonstration requirements;
- Provide support for addressing future enhanced monitoring requirements;
- Provide information sufficient to address equipment scale differences;

An intense testing-based project was conducted which resulted in emission factors for the commonly used rubber compounds and processes. The results of the project and the emission factors now available are presented in Volumes 1 through 3 of this report series. This Applications Manual (Volume 4 of this series) presents a tiered approach for compiling facility HAP emissions, by process, and determining the applicable threshold for a given facility.

1.2 Emission Factor Project Definitions

The following is a brief list of key definitions which define pollutant categories measured in the test program, as well as terminologies which will assist the reader in interpreting the emission factor data provided in this volume.

1. *Total Speciated Volatiles:* The sum of the target volatile organic compounds as well as those compounds tentatively identified during a mass spectral library search.
2. *Total Speciated Semivolatiles:* The sum of the target semivolatile organic compounds as well as those compounds tentatively identified during a mass spectral library search.
3. *TVOC:* Total volatile organic compounds measured as total hydrocarbons (THC) calibrated to a methane standard. Measurements were made on a continuous basis using a THC analyzer in accordance with EPA Reference Method 25A.
4. *Total Metals and Metal HAPs:* The sum of the target analytes detected. The target analytes are cadmium, chromium, copper, cobalt, lead, magnesium, nickel and zinc. Note that the applicable metal HAPs for the rubber industry are Cd, Cr, Pb, Co, and Ni.
5. *Total Sulfur:* The sum of the target sulfur compounds detected during sample analysis using gas chromatography flame photometric detection (GC/FPD).
6. *Total Speciated Organics,* as used in the summary and speciation tables: The total speciated organic compounds measured in the test program is the sum of the speciated semivolatile and volatile emissions for a given rubber compound, minus any duplicate compounds. Where there is duplication of a chemical compound in the analyte list, the higher value was used to present a conservative emissions total. The other value was ignored and not included in the total.
7. *Volatile Organic Compounds (VOCs)* as defined for permitting requirements is based on the EPA definition cited in 52.21:

Volatile Organic Compounds (VOC) means any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate which participates in atmospheric photochemical reactions. This includes any organic compound other than the following which have been determined to have negligible photochemical reactivity:

- (a) Methane (CAS 74-82-8);
- (b) Ethane (CAS 74-84-0);
- (c) 1,1,1-Trichloroethane (CAS 71-55-6);
- (d) Methylene Chloride (CAS 75-09-2);
- (e) Trichlorofluoromethane (CAS 75-69-4);
- (f) Dichlorodifluoromethane (CAS 75-71-8);
- (g) Chlorodifluoromethane (CAS 75-45-6);
- (h) Trifluoromethane (CAS 75-46-7);
- (i) Trichlorotrifluoroethane (CAS 76-13-1);
- (j) Dichlorotetrafluoroethane (CAS 76-14-2);
- (k) Chloropentafluoroethane (CAS 76-15-3);
- (l) Dichlorotrifluoroethane (CAS 306-83-2);
- (m) Tetrafluoroethane (CAS 811-97-2);
- (n) Dichlorofluoroethane (CAS 1717-00-6);
- (o) Chlorodifluoroethane (CAS 75-68-3);
- (p) Chlorotetrafluoroethane (CAS 2837-89-0);
- (q) Pentafluoroethane (CAS 354-33-6);
- (r) Tetrafluoroethane (CAS 359-35-3);
- (s) Trifluoroethane (CAS 420-46-2);
- (t) Difluoroethane (CAS 75-37-6);
- (u) Perchloroethylene (CAS 127-18-4); and,
- (v) the following 4 classes of Perfluorocarbon compounds:
 - (1) Cyclic, branched, or linear, completely fluorinated alkanes;
 - (2) Cyclic, branched, or linear, completely fluorinated ethers with no unsaturation;
 - (3) Cyclic, branched, or linear, completely fluorinated tertiary amines with no unsaturation; and
 - (4) Sulfur-containing perfluorocarbons with no unsaturations and with sulfur bonds only to carbon and fluorine.

1.3 Emission Factor Summary

Generic rubber compounds were used for the mixing/milling, platen press, extruder, autoclave, and warmup mill tests. Data for the calendering, grinding, and tire cure processes were generated in actual manufacturing settings. For tire curing, actual tires from several of the participating companies were used. Table 1-1 presents a list of the evaluated rubber compounds and tire types.

1.4 Report Series Format

The report series for this project is presented in four volumes which are entitled as follows:

- Development of Emissions Factors for the Rubber Manufacturing Industry

--Volume 1	Emission Factor Program Results
--Volume 2	Project Data
--Volume 3	Test Program Protocol
--Volume 4	Applications Manual

The emission factors and examples for their usage are presented in the following sections of this volume (Volume 4). Section 2 presents a discussion of the tiered approach for the emission factors, as well as instructions for the use of the emission factors. Section 3 presents the emission factors for the rubber manufacturing industry based on the tiered thresholds and example scenarios for applying the factors within the industry.

Appendix A presents a comparison of total VOCs, total speciated organics, and total organic HAPs by process for each rubber compound evaluated in this program. Appendix B contains a full listing of the rubber compounds utilized in this program and their formulations.

TABLE 1-1.

INDEX OF RUBBER COMPOUNDS EVALUATED

Compound #1:	Tire Inner Liner (BrIIR/NR)
Compound #2:	Tire Ply Coat (NR/BR)
Compound #3:	Tire Belt Coat (NR)
Compound #4:	Tire Base/Sidewall (NR/BR)
Compound #5:	Tire Apex (NR)
Compound #6:	Tire Tread (SBR/BR)
Compound #7:	Tire Bladder
Compound #8:	EPDM 1 (EPDM Sulfur Cure)
Compound #9:	EPDM 2 (Peroxide Cure)
Compound #10:	EPDM 3 (Non-Black EPDM Sulfur Cure)
Compound #11:	CRW (Polychloroprene W Type)
Compound #12:	CRG (Polychloroprene G Type)
Compound #13:	Paracryl OZO (NBR/PVC)
Compound #14:	Paracryl BLT (NBR)
Compound #15:	Hypalon (CSM)
Compound #16:	Fluoroelastomer (FKM)
Compound #17:	AEM (Vamac)
Compound #18:	Hydrogenated Nitrile (HNBR)
Compound #19:	Silicone (VMQ)
Compound #20:	Acrylate Rubber (ACM)
Compound #21:	Chlorinated Polyethylene (CPE)
Compound #22:	Emulsion SBR (SBR 1502)
Compound #23:	Epichlorohydrin (ECO)
Compound #24:	Oil - Extended SBR (SBR 1712)
Compound #25:	Emulsion SBR (SBR 1500)
Compound #26:	Solution SBR (Duradene 707)

data section 7

INDEX OF TIRES EVALUATED

Tire A	Original Equipment (OEM) - 195/75 R14
Tire B	Replacement - 195/75 R14
Tire C	Replacement - 195/75 R14
Tire D	Original Equipment (OEM) - 195/75 R14
Tire E	High Performance (HP) - 205/70 R14
Tire F	Original Equipment (OEM) - 205/70 R14
Tire G	High Performance (HP) - 205/70 R14
Tire H	High Performance (HP) - 205/70 R14
Tire I	Replacement - 195/75 R14

SECTION 2

EMISSION FACTOR APPLICATION

The results of this study demonstrate the wide variety of HAPs being emitted during the manufacturing of rubber products. Application of the emissions and speciation factors presented in Section 3 will vary depending on several source-specific factors. These include the number and types of products manufactured at the facility, the facility's status with respect to Title V, the operational flexibility required by the source, the recordkeeping and reporting systems in place at the facility, and whether or not the emission factor becomes critical in determining applicability to various regulations (e.g., Title V, Title III, RACT, or enhanced monitoring). The user of this manual should be cautioned, however, to consider all factors when choosing an emission factor as the facility may be required to demonstrate compliance based on the chosen emission factor.

The emission factors (lbs of pollutant emitted/lb rubber) for the various pollutant categories: total organics (regulated as VOCs), total metals, and total particulate are presented on a per rubber compound and per process basis. Additionally, emission and speciation factor means, maxima and standard deviations for each process have also been calculated for all rubber compounds and specialty groupings (e.g., engineered products and tire manufacturing).

Facilities which process several different rubber compounds may use the mean or the maximum for a particular process or grouping to simplify the emissions inventory process. The user is cautioned that, if a mean emission factor is used and rubber formulations yielding higher emissions are the primary compounds processed, the actual emissions may be underestimated. In that particular case, use of the maximum emission factor would be recommended. In general, use of the maximum emission factor value will result in the maximum operational flexibility of the facility.

To calculate emissions using the emission factors presented, the user should simply select the most appropriate factor, based on the facility-specific characterization and needs. The emission factor (lb/lb rubber) would then be multiplied by the amount of rubber processed. To calculate species emissions, the emissions for a given pollutant category (e.g.- organics) would be multiplied by the speciation factor for the desired compound (e.g.- butanol). In cases where emissions for a specific chemical compound are required, the user may obtain a species-specific emission factor (lb/lb rubber) from Volume 2 of the report series.

When applying the factors generated in this project to a multi-step manufacturing process, it must be understood that the relative contribution of each process must be accounted for. For instance, the application of these factors to tire production must take into account the emissions from the mixing, milling, extruding, calendering, and curing processes to determine the total emissions from tire manufacturing.

In the case of tire manufacturing, for example, there were certain chemical species that were not present in all test tires, indicating differences in the chemical composition of the rubber formulations used. Excluding superfluous chemical species from the emission factor allows a higher degree of accuracy for the different companies when estimating emissions for their

different tires. Individual chemicals which can be reasonably excluded need not be assumed to be present simply because the "average passenger tire" emitted the chemical. These individual chemicals can be excluded, but only through detailed knowledge of the formulations in use in combination with literature and available test data.

2.1 Discussion of Tiered Emission Factor Approach

Compliance with Title V and other air permitting requirements can be simplified with a tiered approach. Manufacturers can perform a preliminary screening analysis and determine whether their operation may have the potential to be a major source. Actual emissions would be calculated using process-specific information and emission factors if Tier 1 or Tier 2 screening indicates that the source has the potential to be a major source. Those manufacturers which may be a major source can apply increasingly sophisticated and time-consuming assessments to achieve the greatest possible precision in estimating emissions.

A Tier 1 assessment involves a review of maximum values for total VOCs (measured as total hydrocarbons by EPA Reference Method 25A), total HAPs, and particulate matter (PM).

Figure 2-1. Tier 1 Assessment Strategy

Assessment Step	PTE Threshold	Action
1.1 Total VOC emissions	100 tons/yr (less in nonattainment areas)	No further action if threshold is not exceeded, i.e., if source is a minor source.
1.2 Total HAPs	25 tons/yr total HAPs	No further action if threshold is not exceeded.
1.3 TSP	100 tons/yr (less in nonattainment areas)	No further action if threshold is not exceeded.

A Tier 2 assessment focuses on assessment of organic HAPs when the PTE is more than 10 tons/yr and less than 25 tons/year. It involves a review of mean and maximum values for each organic HAP. Data for each organic HAP (including detection limits for compounds not detected) are listed in tabular format for each process involved at the facility, and summarized for all rubber compounds/products. A total for all manufacturing operations is computed by the plant operator. The data are then sorted by chemical compounds, or species, in the order of decreasing emissions.

Figure 2-2. Tier 2 Assessment Strategy

Assessment Step	PTE Threshold	Action
2.1 HAPs, Maximum concentration values	25 tons/yr for total HAPs 10 tons/yr for individual HAPs	No further action if threshold is not exceeded, i.e., if source is a minor source. This is a conservative approach which provides maximum flexibility in plant operations.
2.2 HAPs, Average concentration values	25 tons/yr for total HAPs 10 tons/yr for individual HAPs	No further action if threshold is not exceeded. This is a less conservative approach which may require a detailed consideration of current and future rubber compounds used at the facility.

A Tier 3 assessment is a detailed assessment performed for all major sources. A user at this point is very concerned about data accuracy and site specificity. The user will extract emissions data which relate specifically to the owner's facility.

The assessment is performed using tables for each process with the following information by chemical compound: total VOCs (as methane), total speciated organics, and total and individual HAPs. The mean, maximum, and standard deviation values are given for the different pollutant categories and individual chemical species.

It is anticipated that perhaps only 90% of the speciated VOC emissions will be identified by name to the agency. Constituents observed at trace or de minimus concentrations will be grouped into a general HAPs category for regulatory reporting purposes.

As the assessment proceeds, the plant operator is able to judge the significance of major HAPs in terms of both the concentration values and the prevalence of each chemical compound across the variety of rubber compounds used at the facility.

Figure 2-3. Tier 3 Assessment Strategy

Assessment Step	PTE Threshold	Action
3.1 HAPs, Maximum concentration values	25 tons/yr for total HAPs 10 tons/yr for a single HAP;	No further action if threshold is not exceeded, i.e., if source is a minor source. This is a conservative approach which provides maximum flexibility in plant operations.
3.2 HAPs, Average concentration values	25 tons/yr for total HAPs 10 tons/yr for a single HAP;	No further action if threshold is not exceeded. This is a less conservative approach which may require a detailed consideration of current and future rubber compounds used at the facility.
3.3 HAPs	10 tons/yr for a single HAP	Consider changing rubber compounds to avoid "problem" HAPs
3.4 HAPs	112(g) limits for major sources	

2.2 How To Use The Emission Factors

- 1) Identify the rubber compound used in your process. Compare your compound with the listed compounds in Table 1-1. Select the matching compound. Appendix B provides further detail on compound recipes for comparison with your particular compound.
- 2) Select the appropriate manufacturing process from the Table of Contents. Find the selected process emission factor table in Section 3. Choose the correct emission factor for your compound and process.
- 3) Four categories of emission factors and a listing of individual HAP's are available. Two categories of organic emission factors are presented:
 - A) Total VOCs (Method 25A)
 - B) Total Speciated Organics (GC/MS)

Note that the Individual Organic HAPs listed in the Section 3 tables are taken from the Total Speciated Organics list. The decision on which of these factors you select will be determined by which method your state or local regulatory agency requires.

- 4) Determine the actual rubber throughput for each rubber compound through each process. Multiply the emission factor (pounds pollutant emitted pounds rubber processed) by the process rubber throughput. The result is expressed in pounds emitted.

- Notes:**
- a) Grinding process emission factors are based on the amount of rubber ground off and not the total process throughput weight, with the exception of retread buffing which is based on pounds of tread throughput.
 - b) Tire curing emission factors are based on pounds of rubber compound and not on total tire weight. A typical passenger tire is approximately 85% by weight rubber compounds. Each facility should determine this percentage for their own tires.
 - c) Internal mixing emission factors (lb/lb rubber mixed) are based on the final quantity (lbs) of productive run rubber because of the varying number of non-productive runs for the different rubber formulations. Productive run throughput is typically the measure used by the industry for production data. The same basis is used here for determining emissions data.

factors were increased to account for total tire wt.

- 5) Although the following calculation procedure is not anticipated to be used for products currently known to be produced in the industry, these emission factors can be used for material which are composites. Emission factors for materials which are composites consisting of multiple compounds can be approximated by determining an overall weighted average emission factor using the appropriate compound emission factors. The weighted average factor is then multiplied by the total throughput to determine the emission.

Example:

95 lbs Compound 1 - Emission Factor (lbs emitted per lb of rubber) = 1.2^{E-05}
275 lbs Compound 2 - Emission Factor (lbs emitted per lb of rubber) = 2.8^{E-05}
150 lbs Compound 3 - Emission Factor (lbs emitted per lb of rubber) = 9.5^{E-06}

Overall Emission Factor:

$$[95 (1.2^{E-05}) + 275 (2.8^{E-05}) + 150 (9.5^{E-06})] / (95 + 275 + 150) =$$

$$1.03^{E-02} / 520 =$$

$$1.97^{E-05} \text{ lbs emitted/lb of rubber}$$

Although a tire undergoing curing is a composite of many rubber compounds, the emission factors for tire curing have been developed separately and can be found in Section 3.

6) Process variables, including compound recipes, process time and temperatures, and processing methods may differ from the tested conditions in an actual manufacturing situation. Emission factors were developed using conservative assumptions to ensure that emissions are not understated. Although adjustments can be made to the published factors based on specific process knowledge and/or scientific test data, care should be exercised in making any upward or downward revision of the published factors. This should only be done if specific, defensible test or engineering data exists for the given process.

7) General Information

A) Emission factors were developed through the testing of twenty-six generic compounds and several rubber products. Testing was conducted on the most commonly used manufacturing processes. Appendix C "Interpolation Factors" provides a method to determine emission factors for a compound not listed in a process summary table.

B) HAPs known to be present, but not detected in actual testing of a particular process, are assumed to be present at the detection level in all processes where not detected. The "<" notation in the table indicates that the compound was not observed in all measurements for a given process or was below the detection limit. The method detection limit was therefore used as a conservative default value.

It should be noted that, if a HAP was not found during any testing of the individual rubber product even though it was suspected to be present, or that HAP is not known to exist in the manufacture of that rubber product, then it is not included in the reported data, even as a "<" value.

C) Metals were expected to be detected in the particulate matter emitted during rubber mixing but were not expected to be a significant emission in any other process. To confirm this assumption, metals were analyzed in the extruder emission. Metals emitted proved to be so small that they could be within the margin of error of the analytical procedure. Metal emissions were therefore considered to be insignificant in other processes and no additional testing was performed.

D) Due to the high reactivity and propensity of formaldehyde to become quickly bound up with other chemicals, formaldehyde was not expected to be a significant emission in any process. Compounds 1 and 7, judged to have the best potential for any formaldehyde emission, were tested for it during the platen press runs. Compound 1 emitted 1.88×10^{-6} lb/lb rubber and compound 7 emitted 1.23×10^{-6} lb/lb of rubber. These small emissions could well be within the margin of error of the analytical procedure. Formaldehyde emissions were therefore considered to be insignificant and no additional testing was conducted.

E) Polycyclic organic matter (POM) emissions are regulated in combustion processes only as clarified by Sally L. Shaver, EPA Director, Air Quality Strategies and Standards Division by a letter dated April 27, 1995 to RMA. POM emissions are therefore not an issue in the processes analyzed in this project.

SECTION 3

PROCESS EMISSION EMISSION FACTORS

The following subsections present information for determining uncontrolled emissions from the individual rubber manufacturing processes. These process examples are organized by the order in which they would typically appear in a typical manufacturing setting. This section is organized as follows:

- 3.1 Internal Mixing
- 3.2 Warmup Milling
- 3.3 Extrusion
- 3.4 Calendering
- 3.5 Tire Press Curing
- 3.6 Steam Heated Pressure Vessel (Autoclave) Curing
- 3.7 Platen Press Mold Curing
- 3.8 Hot Air Oven Curing
- 3.9 Grinding Operations
 - 3.9.1 Sidewall Grinding
 - 3.9.2 Carcass Buffing
 - 3.9.3 Retread Buffing
 - 3.9.4 V-belt Grinding

A table of emission factors for each process or operation is presented at the end of this section.

3.1 Mixing

The emission factor includes the total uncontrolled emissions from an internal mixer and its drop mill or roller die extruder.

The mixing emission factor includes emissions from both non-productive and productive mixing. Table 3-1 presents the emission factors for uncontrolled mixing emissions. Emissions from non-productive mixing are approximately 90% of the total.

Results of testing using a fabric filter (Torit Brand) resulted in the following collection efficiencies:

- | | |
|--------------------|--|
| VOC - | Zero reduction. |
| Particulate (PM) - | Collection efficiency of 99.2% observed. For other types of collectors refer to manufacturers specifications or actual test results. |
| Metal Compounds - | Assumed to be present as particulate matter. |

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Controlled emissions: (Uncontrolled emissions) x (1 - Control Efficiency)

Known: 1,000,000 pounds of Compound 12 were mixed

Find: Uncontrolled and controlled PM emissions

Uncontrolled PM: $(1,000,000 \text{ lbs rubber}) \times (1.83^{E-04} \text{ lbs/lb rubber}) = 183 \text{ lbs PM}$

Controlled PM: $(183 \text{ lbs PM}) \times (1 - 0.992) = 1.5 \text{ lbs PM}$

3.2 Warmup Milling

The emission factor includes the total uncontrolled emissions from a single warmup mill. For example, this would be a mill used prior to a hot feed extruder or a calender. Where multiple mills are used, each mill should be calculated based on its throughput. Table 3-2 presents the warmup mill emissions.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 pounds of Compound 12 were milled

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (1.49^{E-07} \text{ lbs/lb rubber}) = 0.149 \text{ lbs Total HAPs}$

3.3 Extrusion

The emission factor includes the total uncontrolled emissions from a cold feed extruder including the die head and the cooling conveyor. The testing was conducted using an air-cooled conveyor. This factor is applicable to both hot feed and cold feed extruders. Table 3-3 presents the extrusion process emission factors.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 pounds of Compound 6 were extruded

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (3.71^{E-05} \text{ lbs/lb rubber}) =$
37.1 lbs Total HAPs

3.4 Calendering

The emission factor includes the total uncontrolled emissions from a calender or calender line, excluding feed mills. Calendering includes rubber calendering as well as wire and fabric calenders. Table 3-4 presents the calendering process emission factors.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 pounds of Compound 12 were calendered

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (3.49^{E-06} \text{ lbs/lb rubber}) =$
3.49 lbs Total HAPs

3.5 Tire Press Curing

The emission factor includes the total uncontrolled emissions from a passenger tire press using actual green tires furnished by 9 different manufacturers. Three categories of passenger radial tires were tested which included original equipment, replacement and high performance.

Emissions were collected during vulcanizing, press opening, and tire cool-down. Emission factors do not include mold release agents. Consideration must be given to both product type and formulations used when calculating emissions. Table 3-5 presents the tire press emission factors.

Emission factors are based on pounds of rubber compound and not the total tire weight. Typical passenger tires are 85% by weight rubber compounds.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 lbs of rubber by weight of a finished Tire Type A

Find: Uncontrolled Emissions to Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (8.78^{E-05} \text{ lbs/lb rubber}) =$
87.8 lbs Total HAPs

3.6 Steam Heated Pressure Vessel (Autoclave) Curing

The emission factor includes the total uncontrolled emissions from an autoclave. Testing was completed using direct contact with steam on unextruded compounds. The emission factor has been corrected for non-contact steam cure and includes the organic emissions that would have been condensed out in the water phase (approximately 17%). Emissions from mold releases were not included in the testing.

Steam heated pressure vessels include but is not limited to autoclaves, pot heaters, pot kettles, and vulcanizers. Table 3-6 presents these emission factors.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 pounds of Compound 4 were cured in a steam heated pressure vessel

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (2.89^{E-04} \text{ lbs/lb rubber}) =$
289 lbs Total HAPs

3.7 Platen Press Mold Curing

The emission factor includes the total uncontrolled emissions from a platen press and the cooldown cycle. This factor is applicable to injection molding and other types of compression molding. Emissions from mold releases were not included in the testing. Table 3-7 presents the emission factors for the platen press curing operation.

Example Calculations:

Uncontrolled emissions: (lbs of rubber processed) x (Emission Factor)

Known: 1,000,000 pounds of Compound 12 was cured

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (2.30^{E-03} \text{ lbs/lb rubber}) =$
2,300 lbs Total HAPs

3.8 Hot Air Oven Curing

The emission factor includes uncontrolled emissions from the oven and the leakage that may occur during curing.

Example Calculations:

Uncontrolled emissions: $(\text{lbs of rubber cured}) \times (\text{Emission Factor})$

Known: 1,000,000 pounds of extruded SBR was cured

Find: Uncontrolled Total HAP emissions

Uncontrolled Total HAPs: $(1,000,000 \text{ lbs rubber}) \times (2.03^{E-03} \text{ lbs/lb rubber}) =$
2,030 lbs Total HAPs

3.9 Grinding Operations

Several types of grinding operations were evaluated and emission factors developed. These are sidewall grinding, carcass grinding, retread buffing, and V-belt grinding. All factors, except retread buffing, are based on lbs emitted per lb of rubber removed or ground off. The retread buffing factor is based on lbs emitted per lb of rubber processed or buffed. The user should exercise caution in working up the total HAP emissions and ensure use of the proper units. Table 3-9 presents the emission factors for each grinding operation.

3.9.1 White Sidewall Grinding

The emission factor is the total uncontrolled emissions from a grinder producing white sidewall tires. The factor is based upon the pounds of emissions per pound of rubber ground off.

Reductions from passing the emissions through a cyclone separator are:

$$\text{PM} = \cancel{99.2\%} \quad 91.9$$

Example Calculations:

Uncontrolled emissions: $(\text{lbs of rubber ground off}) \times (\text{Emission Factor})$

Controlled emissions: (Uncontrolled emissions) x (1 - Control Efficiency)

Known: 1,000,000 pounds of rubber ground from tires

Find: Uncontrolled and Controlled PM emissions

Uncontrolled PM: (1,000,000 lbs rubber) x (1.0 lbs/lb rubber) =
1,000,000 lbs of Uncontrolled PM emissions

Controlled PM: (1,000,000 lbs PM) x (1 - 0.992) =
8,000 lbs of Controlled PM emissions

3.9.2 Carcass Grinding

The emission factor is the total uncontrolled emissions from a fine grinding module preparing used tires for retreading. Reductions from passing the emissions through a cyclone separator (Retread Equipment Company, Charlotte, NC) are:

$$\text{PM} = \cancel{99.8\%} \leftarrow \text{table footnote says } 99.8$$

The factor is based on the pounds of emissions per pound of rubber ground off.

Example Calculations:

Uncontrolled emissions: (lbs of rubber ground off) x (Emission Factor)

Controlled emissions: (Uncontrolled emissions) x (Control Efficiency)

Known: 1,000,000 pounds of rubber ground off

Find: Uncontrolled and Controlled PM emissions

Uncontrolled PM: (1,000,000 lbs rubber) x (5.45^{E-01} lbs/lb rubber) =
545,000 lbs of Uncontrolled PM emissions

Controlled PM: (545,000 lbs PM) x (1 - 0.998) =
1,090 lbs of Controlled PM emissions

3.9.3 Retread Buffing

The emission factor is the total uncontrolled emissions from four inline buffing wheels. Reductions from passing the emissions thru a cyclone separator and an American Air Filter Baghouse, Model 12-84-1347 are:

$$\text{PM} = 97.8\% \leftarrow \text{table says "baghouse"}$$

Example Calculations:

Uncontrolled emissions: (lbs of rubber ground off) x (Emission Factor)

Controlled emissions: (Uncontrolled emissions) x (Control Efficiency)

Known: 1,000,000 pounds of rubber through the process off

Find: Uncontrolled and Controlled PM emissions

Uncontrolled PM: (1,000,000 lbs rubber) x (9.48^{E-03} lbs/lb rubber) =
9,480 lbs of Uncontrolled PM emissions

Controlled PM: (9,480 lbs PM) x (1 - 0.978) =
280.6 lbs of Controlled PM emissions

3.9.4 V-Belt Grinding

The emission factor is the total uncontrolled emissions from a water-cooled grinder producing V-belts constructed with toluene-based manufacturing aids.

Reductions from passing the emissions through control devices are:

PM:	Cyclone	- 75% (Fisher Kloster XQ-102-20)
PM:	Cyclone plus ESP	- 99.97%

VOCs and HAPs were not reduced by the cyclone and ESP

The factor is based on pounds of emissions per pound of rubber ground off.

Example Calculations:

Uncontrolled emissions: (lbs of rubber ground off) x (Emission Factor)

Controlled emissions: (Uncontrolled emissions) x (control efficiency)

Known: 1,000,000 pounds of rubber through the process off

Find: Uncontrolled and Controlled PM emissions

Uncontrolled PM: (1,000,000 lbs rubber) x (1.0 lbs/lb rubber) =
1,000,000 lbs of Uncontrolled PM emissions

Controlled PM: (1,000,000 lbs PM) x (1 - 0.9997) =
300 lbs of Controlled PM emissions

Chromium														
Nickel														
Cadmium														
Lead														

(1) - Total HAPs include listed individual organic and metal HAP compounds.
(2) - Compounds detected only as tentatively identified compounds (TICs) in emissions from indicated rubber compounds. No applicable data for non-detects.
(3) - Blank correction caused a negative value. A "0" is reported for these cases, but is not included in the statistical summary.

TABLE 3-1. INTERNAL MIXER EMISSION FACTOR SUMMARY
(HAPs Listed Alphabetically)

(1) - Total HAPs include listed individual HAP compounds.
 (2) - Compounds detected only as tentatively identified compounds (TICs) in emissions from indicated rubber compounds. No applicable data for non-detects.
 (3) - Blank correction caused a negative value. A "0" is reported for these cases, but is not included in the statistics summary.

TABLE 3-1A. INTERNAL MIXER EMISSION FACTOR SUMMARY
(HAPs Listed In Descending Order by Means)

(1) - Total HAPs include listed individual organic and metal HAP compounds.
(2) - Compounds detected only as tentatively identified compounds (TICs) in emissions from indicated rubber compounds. No applicable data for non-detects.
(3) - Blank correction caused a negative value. A "0" is reported for these cases, but is not included in the statistics summary.

(1) - Total HAPs include listed individual HAP compounds.
 (2) - Compounds detected only as tentatively identified compounds (TICs) in emissions from indicated rubber compounds. No applicable data for non-detects.
 (3) - Blank correction caused a negative value. A "0" is reported for these cases, but is not included in the statistics summary.

Table 3-2. WARMUP MILL EMISSION FACTOR SUMMARY
(HAPs Listed Alphabetically)

Pollutant Category	CAS Number	Cmpd. 2	Cmpd. 3	Cmpd. 4	Cmpd. 12	Mean	Max.	Std. Dev.

Compounds 2, 3, and 4 were conducted on Warmup Mill No. 2. A single test run was conducted on each compound.
Compound 12 was conducted on Warmup Mill No. 1. Data are averages of three test runs.

Hexachlorobenzene	118-74-1	< 7.46E-09	< 1.29E-08	< 4.58E-09	< 5.71E-11	< 6.24E-09	< 1.29E-08	4.65E-09
Nitrobenzene	98-95-3	< 5.37E-09	< 1.41E-08	< 4.38E-09	< 4.35E-11	< 5.97E-09	< 1.41E-08	5.09E-09
1,2,4-Trichlorobenzene	120-82-1	< 5.25E-09	< 1.39E-08	< 4.33E-09	< 4.19E-11	< 5.89E-09	< 1.39E-08	5.04E-09
Benzyl Chloride	100-44-7	< 3.22E-09	< 9.88E-09	< 3.04E-09	< 6.93E-09	< 5.77E-09	< 9.88E-09	2.84E-09
o-Toluidine	95-53-4	< 4.29E-09	< 1.32E-08	< 4.04E-09	< 3.41E-11	< 5.38E-09	< 1.32E-08	4.80E-09
1,4-Dichlorobenzene	106-46-7	< 4.07E-09	< 1.26E-08	< 3.84E-09	< 3.40E-11	< 5.13E-09	< 1.26E-08	4.59E-09
Cumene	98-82-8	< 2.37E-09	1.47E-08	1.44E-09	2.48E-11	< 4.63E-09	1.47E-08	5.85E-09
3,3'-Dimethoxybenzidine	119-90-4	< 3.79E-09	< 1.08E-08	< 3.29E-09	< 7.37E-11	< 4.48E-09	< 1.08E-08	3.90E-09
4-Nitrobiphenyl	92-93-3	< 4.69E-09	< 8.08E-09	< 2.84E-09	< 4.32E-11	< 3.91E-09	< 8.08E-09	2.92E-09
4,4'-Methylenedianiline	101-77-9	< 3.22E-09	< 9.13E-09	< 2.74E-09	< 5.31E-11	< 3.79E-09	< 9.13E-09	3.31E-09
Benzidine	92-87-5	< 2.32E-09	< 6.58E-09	< 1.99E-09	< 3.19E-11	< 2.73E-09	< 6.58E-09	2.39E-09
4-Aminobiphenyl	92-67-1	< 2.49E-09	< 4.34E-09	< 1.54E-09	< 7.77E-11	< 2.11E-09	< 4.34E-09	1.55E-09
3,3'-Dimethylbenzidine	119-93-7	< 1.58E-09	< 4.49E-09	< 1.35E-09	< 2.43E-11	< 1.86E-09	< 4.49E-09	1.63E-09

Compounds 2, 3, and 4 were conducted on Warmup Mill No. 2. A single test run was conducted on each compound.
Compound 12 was conducted on Warmup Mill No. 1. Data are averages of three test runs.

A blank space indicates that the compound was a Tentatively Identified Compound (TIC) and was not detected in that sample.
A "0" indicates a blank correction that resulted in a "0" or a negative value.

A blank space indicates that the compound was a Tentatively Identified Compound (TIC) and was not detected in that sample.
A "0" indicates a blank correction that resulted in a "0" or a negative value.

(a) - Compound 5 was green unextruded rubber. Compounds 8 and 22 were preextruded general products.

A "0.00" signifies a value that was blank-corrected to zero or a negative value.

A blank space means that the compound was a Tentatively Identified Compound (TIC) and was not detected in that sample.

(a) - Compound 5 was green unextruded rubber. Compounds 8 and 22 were preextruded general products.

A "0.00" signifies a value that was blank-corrected to zero or a negative value.

A blank space means that the compound was a Tentatively Identified Compound (TIC) and was not detected in that sample.

(a) - Sidewall, Carcass, and Belt Grinding - pounds emitted per pound of rubber removed or ground off (lb/lb rubber removed).

(b) - Retread Buffing - pounds emitted per pound of rubber processed (lb/lb rubber processed).

(c) - For uncontrolled PM emissions from Sidewall, Carcass, or Belt Grinding, use a factor of 4.0 lb emitted per lb of rubber removed.

(d) - Total HAP emissions listed here do not include the uncontrolled PM or metal emission factors. User should apply own control efficiency for determining PM or metal emissions. Values shown are the means of three replicate test runs conducted on each grinding operation.

(e) - Value exceeds that of total VOC. This discrepancy is being investigated.

All factors presented are based on the production or processing of 1 million pounds of rubber.

** - SBR copolymer data are not included in mixing averages.

"X" - denotes a rubber compound that was evaluated for the indicated process.

"O" - denotes a rubber compound that is commonly used in the indicated process, but for which

no test data exists. Emission data for that compound can be derived through use of a ratioed factor.

APPENDIX B

RUBBER COMPOUND INFORMATION

INDEX OF RUBBER COMPOUNDS

- Compound #1: Tire Inner Liner (BrIIR/NR)
- Compound #2: Tire Ply Coat (Natural Rubber/Synthetic Rubber)
- Compound #3: Tire Belt Coat (Natural Rubber)
- Compound #4: Tire Base/Sidewall (Natural Rubber/Polybutadiene Rubber)
- Compound #5: Tire Apex (Natural Rubber)
- Compound #6: Tire Tread (Styrene Butadiene Rubber/Polybutadiene Rubber)
- Compound #7: Tire Bladder (Butyl Rubber)
- Compound #8: EPDM 1 (EPDM Sulfur Cure)
- Compound #9: EPDM 2 (Peroxide Cure)
- Compound #10: EPDM 3 (Non - black EPDM Sulfur Cure)
- Compound #11: CRW (Polychloroprene W Type)
- Compound #12: CRG (Polychloroprene G Type)
- Compound #13: Paracryl OZO (NBR/PVC)
- Compound #14: Paracryl BLT (NBR)
- Compound #15: Hypalon (CSM)
- Compound #16: Fluoroelastomer (FKM)
- Compound #17: AEM (Vamac)
- Compound #18: Hydrogenated Nitrile (HNBR)
- Compound #19: Silicone (VMQ)
- Compound #20: Acrylate Rubber (ACM)
- Compound #21: Chlorinated Polyethylene (CPE)
- Compound #22: Emulsion SBR (SBR 1502)
- Compound #23: Epichlorohydrin (ECO)
- Compound #24: Oil - Extended SBR (SBR 1712)
- Compound #25: Emulsion SBR (SBR 1500)
- Compound #26: Solution SBR (Duradene 707)

RUBBER COMPOUND RECIPES

Compound #1: Tire Inner Liner (BrIIR/NR)

Recipe:

Brominated IIR X-2	85.00
SMR 20 Natural Rubber	15.00
GPF Black	60.00
Stearic Acid	1.00
Paraffinic Medium Process Oil	15.00
Unreactive Phenol formaldehyde type resin (Aroclene 8318, SP1068)	5.00
Zinc Oxide	3.00
Sulfur	.50
MBTS	1.50
	186.00

Number of Passes/Temperature:

1 (NP) Temperature: 320°F; Chlorobutyl or 290°F Bromobutyl

2 (P) Temperature: 220°F

Compound #2: Tire Ply Coat (Natural Rubber/Synthetic Rubber)

Recipe:

50472 Natural Rubber	
SMR-GP Natural Rubber	70.00
Duradene 707	30.00
N330	36.50
Sundex 790	20.00
Flectol H	1.50
Santoflex IP	2.30
Sunproof Super Wax	1.20
Zinc Oxide	5.00
Stearic Acid	1.00
Sulfur	2.30
CBS	.80
	170.60

Number of Passes/Temperature:

1 (NP) Temperature: 330°F

2 (P) Temperature: 220°F

Compound #3: Tire Belt Coat (Natural Rubber)

Recipe:

#1RSS Natural Rubber	100.00
HAF Black (N330)	55.00
Aromatic Oil	5.00
N-(1,3 dimethylbutyl) -N-phenyl-P-phenylene diamine (Santoflex 13)	1.00
Zinc Oxide	10.00
Stearic Acid	2.00
n-tertiary-butyl-2-benzothiazole disulfide (Vanax NS)	.80
Sulfur	4.00
Cobalt Neodecanate (20.5% cobalt)	2.50
	180.30

Number of Passes/Temperatures:

1 (NP) Temperature: 330°F; add 1/2 black, add 1/2 oil

2 (NP) Temperature: 330°F; add remainder of black and oil

3 (remill) Temperature 300°F

4 (P) Temperature: 220°F

Compound #4: Tire Base/Sidewall (Natural Rubber/Polybutadiene Rubber)*Non-Productive Recipe:*

NR-SMR-5 CV	50.00
Taktene 1220	50.00
N330 Carbon Black	50.00
Zinc Oxide	1.50
Stearic Acid	2.00
Agerite Resin D	2.00
Vulkanox 4020	3.00
Vanwax H Special	3.00
Flexon 580 Oil	10.00
	171.50

Productive Recipe:

Non Productive	171.50
Zinc Oxide	1.50
Rubber Maker Sulfur	1.75
DPG	0.10
CBS	0.60
	175.45

Number of Passes/Temperatures:

1 (NP) Temperature: 330°F

2 (P) Temperature: 220°F

Compound #5: Tire Apex (Natural Rubber)*Recipe:*

TSR 20 Natural Rubber	100.00
HAF Black (N330)	80.00
Aromatic Oil	8.00
Stearic Acid	1.00
Resorcinol	3.00
Hexamethylenetetramine	3.00
Zinc Oxide	3.00
N-tertiary -butyl-2-benzothiazole disulfide (Vanax NS)	1.50
n-cyclohexylthiophthalimide (Santogard PVI)	.30
Sulfur	3.00
	202.80

1 (NP) Temperature: 330°F; add 60 parts black, add 6 parts oil

2 (NP) Temperature: 330°F; add Resorcinol, add 20 parts black, add 2 parts oil

3 (P) Temperature 200°F; add Hexam.

Compound #6: Tire Tread (Styrene Butadiene Rubber/Polybutadiene Rubber)*Non-Productive Recipe #1:*

SBR 1712C	110.00
N299 Carbon Black	60.00
Taktene 1220	20.00
Zinc Oxide	1.50
Stearic Acid	3.00
Vulkanox 4020	2.00
Wingstay 100	2.00
Vanox H Special	2.50
Sundex 8125 Oil	20.00
	221.00

Non-Productive Recipe #2:

Non-Productive #1:	221.00
N299 Carbon Black	20.00
Sundex 8125 Oil	5.00
	246.00

Productive Recipe:

Non Productive #2	246.00
Zinc Oxide	1.50
Rubber Maker Sulfur	1.60
TMTD	0.20
CBS	3.00
	252.30

Number of Passes/Temperatures:

- 1 (NP) Temperature: 330°F; add 60 parts black, add 20 parts oil
2 (NP) Temperature: 330°F; add 20 parts black; add 5 parts oil
3 (P) Temperature: 220°F

Compound #7: Tire Bladder*Recipe:*

BUTYL 268	100.00
N330	55.00
Castor Oil	5.00
SP 1045 Resin	10.00
Zinc Oxide	5.00
Neoprene W	5.00
	180.00

Number of Passes/Temperatures:

- NP 1 All Butyl, Castor Oil, Zinc Oxide, 45 phr N330, discharge approx 330°F/340°F
+ Resin, 10 phr N330, discharge approx 270/280°F DO NOT EXCEED 290°F
PROD NP2 = neoprene, discharge approx 250°F/260°F

Compound #8: EPDM 1 (EPDM Sulfur Cure)*Non-Productive Recipe:*

Vistalon 7000	50.00
Vistalon 3777	87.50
N650 GPF-HS Black	115.00
N762 SRF-LM Black	115.00
Process Oil Type 104B (Sunpar 2280)	100.00
Zinc Oxide	5.00
Stearic Acid	1.00
	473.50

Productive Recipe:

Non-Productive	473.50
Sulfur	0.50
TMTDS	3.00
ZDBDC	3.00
ZDMDC	3.00
DTDM	2.00
	485.00

Number of Passes/Temperatures

1 (NP) Temperature: 340°F; upside down mix. rubber then black and oil

2 (P) Temperature: 220°F

Compound #9: EPDM 2 (Peroxide Cure)*Non-Productive Recipe:*

Royalene 502	100.00
N 762 Carbon Black	200.00
Sunpar 2280 Oil	85.00
Zinc Oxide	5.00
Stearic Acid	1.00
	391.00

Productive:

Non-Productive	391.00
DICUP 40C	6.00
SARET 500 (on carrier/2 parts active)	2.56
	399.56

NP Temperature: 330°F

P Temperature: 240°F

Compound #10: EPDM 3 (Non-black EPDM Sulfur Cure)*Recipe:*

Vistalon 5600	50.00
Vistalon 3777	87.50
Hard Clay (Suprex)	180.00
Mistron Vapor Talc	100.00
Atomite Whiting	40.00
Process Oil Type 104B (Sunpar 2280)	60.00
Silane (A-1100)	1.50
Paraffin Wax	5.00
Zinc Oxide	5.00
Stearic Acid	1.00
Sulfur	1.50
Cupsac	0.50
TMTD	3.00
	535.00

Number of Passes/Temperatures:

1 (NP) Temperature: 330°F

2 (P) Temperature: 220°F, add Sulfur, Cupsac, and TMTDS

Compound #11: CRW (Polychloroprene W Type)*Recipe:*

Non Productive:

Neoprene WRT	100.00
N 550	13.20
N 762	15.70
Agerite Staylite S	2.00
Sunproof Super Wax	2.00
Santoflex IP	1.00
Magnesium Oxide	4.00
Stearic Acid	0.50
PlastHall Doz	15.00
	153.40

Productive Recipe:

Non - Productive

Zinc Oxide	153.40
TMTD	5.00
Dispersed Ethylene Thiourea	0.50
	1.00
	159.90

Number of Passes/Temperatures:

1 pass at 240°F; add accelerator package at 200°F

Compound #12: CRG (Polychloroprene G Type)*Non Productive Recipe:*

Neoprene GN	100.00
SRF	50.00
Sundex 790	10.00
Octamine	2.00
Stearic Acid	1.00
Maglite D	4.00
	167.00

Productive Recipe:

Non - Productive

TMTM	167.00
Sulfur	0.50
DOTG	1.00
Zinc Oxide	0.50
	5.00
	174.00

Number of Passes/Temperatures:

1 (NP) Temperatures: 240°F; add zinc oxide and cureatives late at 200°F

2 (P) Temperature: 200°F

Compound #13: Paracryl OZO (NBR/PVC)*Recipe:*

PARACRIL OZO	100.00
Zinc Oxide	5.00
OCTAMINE	2.00
Hard Clay	80.00
FEF (N-550) Black	20.00
Stearic Acid	1.00
MBTS	2.50
TUEX	1.50
ETHYL TUEX	1.50
DOP	15.00
KP-140	15.00
Spider Sulfur	0.20
	243.70

Number of Passes:

(NP) Temperature: 330°F

(P) Temperature: 220°F; add MBTS, TUEX, ETHYL TUEX, Spider Sulfur

Compound #14: Paracryl BLT (NBR)*Recipe:*

PARACRIL BLT	100.00
Zinc Oxide	5.00
SRF (N-774) Black	100.00
TP-95	15.00
Paraplex G-25	5.00
AMINOX	1.50
Stearic Acid	1.00
ESEN	0.50
MONEX	1.50
Sulfur	0.75
	230.25

Number of Passes/Temperatures:

(NP) Temperature: 280°F

(P) Temperature: 220°F; add sulfur, MONEX, and possibly ESEN

Compound #15: Hypalon (CSM)*Recipe:*

Hypalon 40	100.00
CLS 4 PBD	3.00
Carbo wax 4000	3.00
PE 617A	3.00
Mag Lite D	5.00
PE 200	3.00
Whiting (Atomite)	100.00
N650	100.00
TOTM Oil	70.00
MBTS	1.00
Tetrone A	1.50
NBC	0.50
HVA-2	0.50
	390.50

Uses of Formulas/Temperatures:

Number of Passes:

1 (P) Temperature: 280°F

Compound #16: Fluoroelastomer (FKM)*Recipe:*

Viton E60C	100.00
N990 Black	20.00
Calcium Hydroxide	6.00
Maglite D	3.00
	129.00

Compound #17: AEM (Vamac)*Recipe:*

VAMAC*B-124 Masterbatch	124.00
ARMEEN 18D	.50
Stearic Acid	.20
SRF Carbon Black (N-774)	10.00
DIAK #1	4.00
DPG	4.00
	142.70

Compound #18: Hydrogenated Nitrile (HNBR)*Non-Productive Recipe:*

HNBR Zetpol 2020	100.00
N650 Black	45.00
Flexone 7P	1.00
Agerite Resin D	1.00
ZMTI	1.00
Kadox 911 C	5.00
Stearic Acid	1.00
Trioctyl trimellitate (TOTM)	7.00
	161.00

Productive Recipe:

Sulfur	0.50
MBTS	1.50
TMTD	1.50
MTD Monex	.50
	165.00

Number of Passes/Temperatures:

1 (NP) Temperature: 275°F

2 (P) Temperature: 210°F

Compound #19: Silicone (VMQ)*Recipe:*

Silicone Rubber	70.00
Silastic NPC-80 silicone rubber	30.00
5 Micron Min-U-Sil	68.00
Silastic HT-1 modifier	0.80
Vulcanizing agent: Varox DBPH 50	1.00
	169.80

Compound #20: Acrylate Rubber (ACM)*Non-Productive Recipe:*

Hytemp AR71	100.00
Stearic Acid	1.00
N 550	65.00
	166.00

Productive Recipe:

Non-Productive	166.00
Sodium Stearate	2.25
Potassium Stearate	0.75
Sulfur	0.30
	169.30

Number of Passes/Temperatures:

1 (NP) Temperature: 260°F

2 (P) Temperature: 220°F

Compound #21: Chlorinated Polyethylene (CPE)*Recipe:*

CM 0136	100.00
Maglite D	10.00
N 774 Black	30.00
Sterling VH	35.00
DER 331 DLC	7.00
Agerite Resin D	0.20
TOTM Oil	35.00
Triallyl Isocyanurate Cure 5223 (provided by Gates)	2.90
Trigonox 17/40	10.00
	230.10

Number of Passes/Temperatures:

Single pass mixed to 240°F; add Triallylisocyanurate.

Triganox 17/40 at 200°F.

Compound #22: Emulsion SBR (SBR 1502)*Non-Productive Recipe:*

SBR 1502	100.00
N330 Carbon Black	58.50
Zinc Oxide	10.00
Stearic Acid	2.00
Agerite Resin D (Naugard Q)	2.00
Flexone 7P	1.00
Sunproof Super Wax	1.50
Sundex 790 Oil	7.00
	182.00

Productive Recipe:

Non-Productive	182.00
Rubber Makers Sulfur	2.00
TBBS	1.80
	185.80

Number of Passes/Temperatures:

Non-productive pass mixed to 330°F,

Second pass mixed to 220°F.

Compound #23: Epichlorohydrin (ECO)*Recipe:*

Hydrin 2000	100.00
N330 Carbon Black	50.00
Stearic Acid	1.00
Vulkanox MB-2/MG/C	1.00
Calcium Carbonate	5.00
Zisnet F-PT	1.00
Diphenylguanadine	0.50
Santogard PVI	0.50
	<u>159.00</u>

Number of Passes/Temperatures:

1 Pass at 240°F

Compound #24: Oil-Extended SBR (SBR 1712)*

SBR 1712	<u>137.50</u>
	137.50

Compound #25: Emulsion SBR (SBR 1500)*

SBR 1500	<u>100.00</u>
	100.00

Compound #26: Solution SBR (Duradene 707)*

Duradene 707	<u>100.00</u>
	100.00

* - Compounds 24, 25, and 26 were mixes of polymer only, with no fillers or cure system.

APPENDIX C

INTERPOLATION FACTORS

To determine the emission factor for a compound not listed in a PROCESS EMISSION FACTOR SUMMARY TABLE, multiply the TABLE 3-1 value of that compound by the following factors:

	<i>VOC</i>	<i>Speciated Organics</i>	<i>Organic HAPs</i>	<i>Metal HAPs</i>	<i>Total HAPs</i>	<i>PM</i>
Mill	0.73	0.33	0.26	--	0.26	--
Extruder	0.13	0.29	0.41	6.62	0.42	0.04
Calender	0.27	0.40	0.18	--	0.18	--
Autoclave	1.42	9.09	7.21	--	7.21	--
Platen Press	5.80	27.14	43.40	--	43.40	--
Hot Air Oven	7.39	21.43	22.64	--	22.64	--

Note: When metals are insignificant, total HAPs are the same as organic HAPs.
