TECHNICAL BULLETIN NO. 694

ORIENTED STRANDBOARD AND PLYWOOD AIR EMISSION DATABASES

Over the last five years, a considerable amount of emission testing has been conducted at panel plants and other solid wood products manufacturing facilities. The industry believed it would be of value to compile and organize individual plant test data and make the compilation broadly available to the industry. The compilation would be useful to individual plants involved in preparing air quality permit applications, and would also serve to identify source types and pollutants for which little data were available. It was hoped the data gaps identified would eventually be filled by additional testing.

With the support of the American Forest and Paper Association's Wood Products Environmental Task Group, the National Particleboard Association, the American Hardboard Association, and the APA - the Engineered Wood Products Association, the National Council created a computerized Wood Products Database. The database was developed from emission test reports provided by wood products plants. The database contains source sampling data along with associated equipment and relevant process information.

Although the Wood Products Database is intended principally for personal computer use, many potential users expressed a desire for a printed version as well. Because of the large size of the whole database, it was decided to subdivide the printed version into three subsets (particleboard and medium density fiberboard; plywood and oriented strandboard; and combustion units) with each subset contained in a separate technical bulletin. A future additional technical bulletin will cover hardboard, roof insulation board, fiberboard sheathing and specialty fiberboard product plants.

This technical bulletin describes the oriented strandboard (OSB) and plywood portion of the database. The master Wood Products Database has been compiled electronically using a common database software package and is available on diskette. The data in the appendices of this report are simply a printout of selected

© National Council of the Paper Industry for Air and Stream Improvement, Inc. 1995

searches are the most efficient means of extracting information from the database, users are encouraged to become familiar with the database structure and associated database software. Spreadsheet software may also be used to access the database, but sorting and querying the database will be more difficult.

Work on the Wood Products Database will continue in 1995. The printed version of the database in these three technical bulletins and the current electronic version now available on diskette represent "Version 1.0". With continued support from the wood products industry, the database will grow, include more diverse information, and become an increasingly useful resource for the industry.

The database was developed by Dr. David H. Word, Research Engineer at the Southern Regional Center. Dr. Word prepared this report. John Milner and Steven Cloutier, Research Technical Associates, assisted in the data compilation. Mr. Milner performed the formidable task of formatting and printing the tables for the report.

Questions and comments on this report and the Wood Products Database are encouraged. Especially useful would be comments regarding the ease-of-use of the computer and printed versions of the database, and suggestions for ways to improve the data organization within the database. All comments should be directed to Dr. Word at 904-377-4708, ext. 241 or to Dr. John Pinkerton at this office.

Very truly yours,

Ronald A. Yeske, PhD.
President

TABLE OF CONTENTS

ORIENTED STRANDBOARD AND PLYWOOD AIR EMISSION DATABASES

TECHNICAL BULLETIN NO. 694
APRIL 1995

ABSTRACT: A database containing emission sampling data and associated process and equipment information for oriented strandboard (OSB) and plywood plants is described. Excluding boiler data, 16 OSB mills contributed information totaling approximately 500 sample runs and 1500 individual pollutant values, and nine plywood mills contributed information totaling approximately 150 sample runs and 350 individual pollutant values. Pollutant values are generally expressed as a concentration, a mass rate, and a production based rate. Pollutant values can be linked, through the database, to specific types of equipment and to specific operating or process conditions. Equipment and process information are supplied as received from the mills, therefore the amount of process information associated with a particular pollutant value is variable. Most of the emission measurements are for particulate matter, carbon monoxide, nitrogen oxides, volatile organic compound, and formaldehyde from wood dryers and presses. Some information is available on other pollutants such as phenol and acetaldehyde and on smaller particulate emission sources such as planers and sanders.

KEYWORDS: wood panels, air emissions, source sampling, wood products, pollutants, wood dryer, press, emission factors, OSB, plywood, particulate matter, carbon monoxide, nitrogen oxide, VOC, PM_{10}, formaldehyde

ORIENTED STRANDBOARD AND PLYWOOD AIR EMISSION DATABASES

I INTRODUCTION

This technical bulletin is essentially a "hard copy" of a computerized database accompanied by descriptive material and instructions for its use. The purpose of the database is to provide the wood products industry with available air emission data and a means of segregating those data to fit their specific needs.

Five previous NCASI technical bulletins (Nos. 405, 493, 503, 504 and 657) and Special Report No. 89-05 contain emissions data from wood products facilities. These reports have provided plants with information useful for permitting, emission inventory purposes, and checking their own plant's stack sampling results. Additionally, these reports have provided analyses of measurement methods and the effects of various process parameters on emission levels.

The computerized database project, unlike the projects that resulted in the earlier technical bulletins, was not designed as a "study" or investigation into a certain area. The purposes of this project were to design a database structure that would accommodate wood product plant emission and process data and to compile available information into that structure. Clearly, the industry wanted a database that would allow it to use very specific criteria in selecting a set of emission factors. Additionally, the industry wanted a product that could be updated periodically and that would become increasingly useful over time. The database described in this report is intended to meet the industry's expectations.

The Wood Products Database is available on diskette and is structured for personal computer use. For those comfortable with computers and familiar with database software packages, sorting the data will be quick and relatively easy. Users of this printed copy will also be able to sort and segregate; the process will simply take more time. A form for member companies of NCASI, NPA, APA, AF&PA and AHA to order the database on diskette can be found in Appendix E.

II DATA SOURCES AND DATA QUALITY

In the summer of 1993, the National Particleboard Association (NPA), the American Hardboard Association (AHA) and APA - the Engineered Wood Products Association distributed to their respective members a survey instrument along with a request for air emission test data. The survey instrument was designed

to collect information about the equipment that had been tested, as well as pertinent process and raw material information specific to the testing period.

From inception the idea was not just to gather emission data on a rotary dryer, for example, but to gather data on a direct fired, single pass rotary dryer controlled by a wet electrostatic precipitator drying 50 percent poplar and 50 percent fir and operating at a dryer inlet temperature of 1100°F. For the wood products industry this amount of detail is important because the process and raw material parameters have a considerable impact on certain pollutant emission rates.

Since companies and mills were asked to voluntarily submit their information, the amount and quality of data submitted varied considerably. The amount of process information accompanying the test reports varied from none to complete. Company submitted information concerning the equipment, process and production rate was generally assumed to be correct. In some cases clarification was obtained. Incomplete or unavailable data are simply indicated by a blank space in the database.

In most cases the pollutant concentration and mass emission rate information provided in the stack test report were assumed to be correct. However, unusually high or low sample runs within a set of runs were checked.

Decisions had to be made concerning which data to keep and which to discard. For example, if a press had four vents and only one was tested, the data were generally discarded. If a dryer had two twin cyclones and only one was tested, the mass emission rates were generally doubled and included. If a press had six vents and three were tested, that data may have been included with notes in the comments. For cases in which some assumptions had to be made, the assumptions were generally provided in the comments section of the applicable table. Some reports were simply not used due to lack of process data, lack of information on emission points or for other reasons.

III DATABASE STRUCTURE

A. Introduction

It is important that the user understand the overall structure of the database and how the various tables are related. A general overview will first be provided followed by a more detailed explanation of the individual tables. The oriented strandboard (OSB) database is in Appendix A, and the plywood database is in Appendix B. Codes or abbreviations are explained in Appendix C. A glossary and an explanation of column (field) headings are in Appendix D.

The Wood Products Database might be thought of as a set of building blocks that can be reconfigured in numerous ways depending on the user's needs. The Wood Products Database or "master" database is a composite comprised of numerous linked or related files. For the purpose of these written reports, the master database has been subdivided into five smaller databases. They are: (1) OSB, (2) plywood, (3) MDF, (4) particleboard, and (5) combustion units.

B. Overview of Structure and Table Links

The structure for the Wood Products Database is provided in Figure 1. With the exception of the MDF database, all of the smaller databases are lacking two or more of the tables shown in Figure 1. Tables are grouped according to type or function and are joined or linked according to common codes.

The Reports Table, which contains stack gas parameters and other information, can be thought of as the heart of the database. It contains one record (row) for every sample run in the database. Each sample run has been assigned a run number, test code and unit code, the combination of which is (and must be) unique to the Reports Table.

Each record (row) in the Reports Table has a corresponding record in one of the "B Tables." The two records are linked through common Test Code/Unit Code/Run Number combinations. The "B Tables" provide process information specific to the individual test run.

Similarly, each record in one of the Pollutant Tables can be linked to either the Reports Table or a "B Table" through its identifying Test Code/Unit Code/Run Number. However, there is not a one-to-one relationship between the records in the Reports Table and the records in the Pollutants Tables. There are two reasons for this: (1) multiple pollutants can be tested for in the same sample run; and (2) multiple methods can be used for the same pollutant in the same sample run. Thus, the Test Code/Unit Code/Run Number combination that represents a single sample run in the Reports Table can occur in more than one pollutant table and more than once in an individual pollutant table.

The "A Tables" contain information about the equipment being tested. Each individual unit (or combination of units) has a unique Unit Code. Since the equipment generally does not change from test to test, neither does the unit code. Thus, a single record in one of the "A Tables" describes the equipment for multiple records in the Reports Table, "B" Tables and Pollutant Tables (see Unit Codes below).

The General Information Table contains information about the facility or mill such as product produced and tree species generally used. The General Information Table and the Reports Table are linked by a Facility Code. These two tables are the

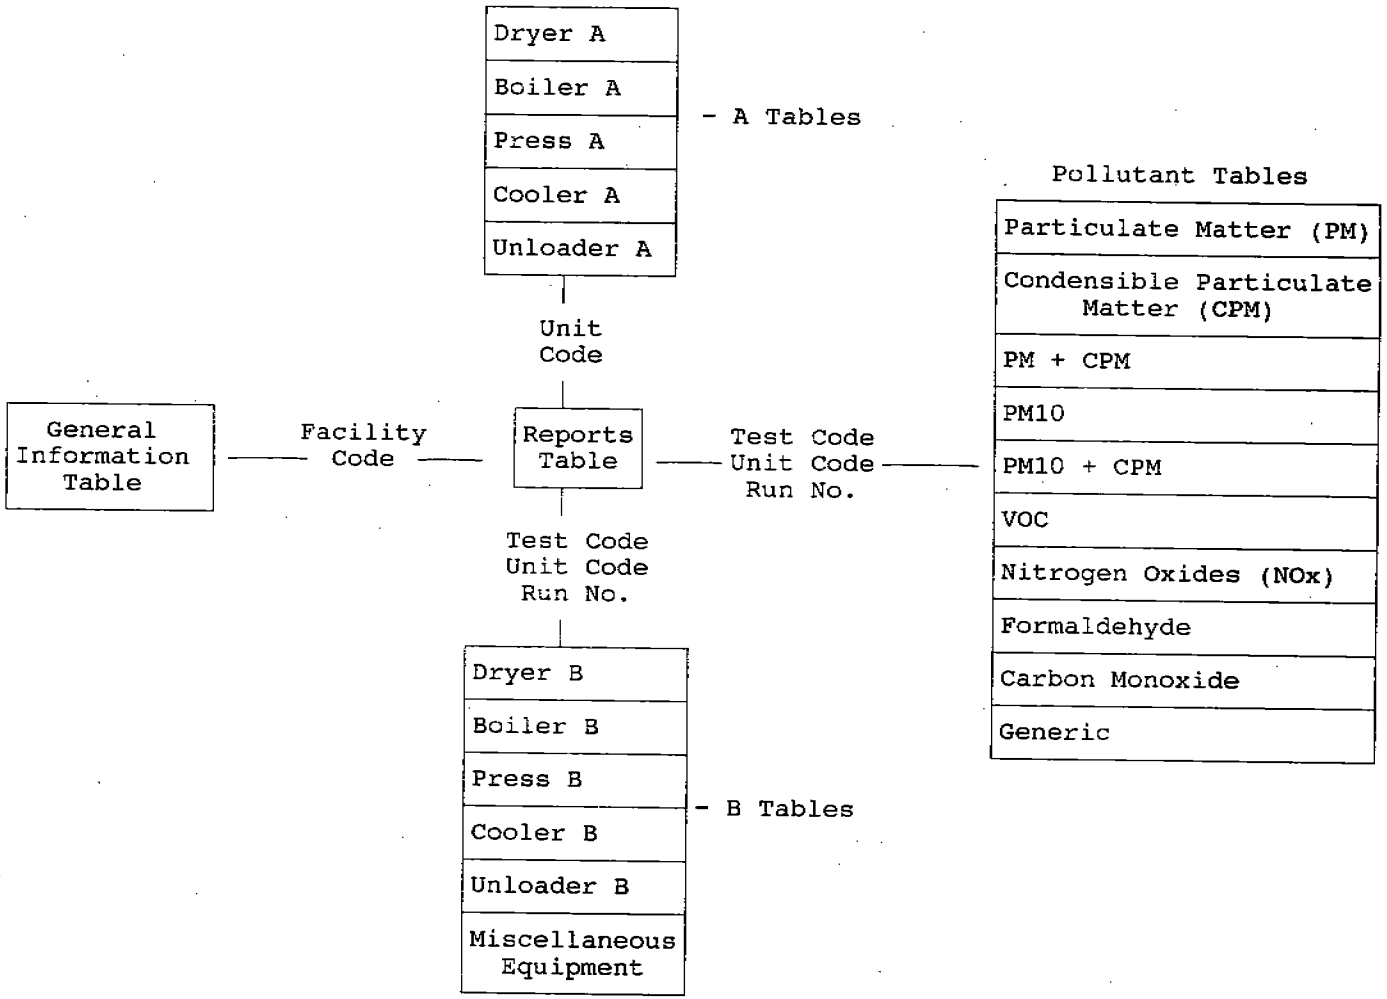

FIGURE 1 DATABASE STRUCTURE

only tables containing this particular code. The major purpose of the General Information Table is to provide a means for sorting the database information by panel or product type. For this printed version, the Wood Products Database has already been segregated by panel type, and the General Information Table is somewhat moot.

C. Unit Codes, Test Codes and Facility Codes

(1) Facility Codes - Each mill that supplied information was assigned a Facility Code. The Facility Code is a three digit number that appears in the General Information Table and the Reports Table. The facility code also is part of each assigned Unit Code and Test Code.

(2) Unit Codes - Unit codes consist of an arbitrary first digit followed by a letter indicating a type of unit and a three digit facility code. If multiple units have a common stack, the first digit is replaced with an X, Y or Z. For example, a press might be assigned a unit code of 1P888 and two dryers venting to a common stack might have a unit code of XD888. The unit code letters and corresponding equipment types are provided in Table 1.

TABLE 1 IDENTIFYING LETTERS USED IN UNIT CODES

D	Dryer	A	Planer
P	Press	E	Screening
B	Boiler	F	Former
C	Cooler	I	Dust Bin or Silo
U	Unloader	M	Mill (hammermill)
		N	Pneumatic Conveyor
		R	Refiner
		S	Sander
		W	Saw
		Z	Miscellaneous

The assignment and use of Unit Codes can best be explained through an example:

> In 1988 facility 999 had two single pass dryers each with its own product cyclone and stack. It also had three new triple pass dryers that all vented to a common WESP and stack. In a 1993 modification, the two single pass dryers were connected to a single WESP. Stack test reports for this mill were submitted for 1989 and 1994. All dryers were tested.
>
> For the 1989 test report the two single pass dryers would be coded 1D999 and 2D999. The three triple pass dryers with the common stack would be given the single code XD999. For the 1994 test report the three triple pass dryers did not change and would keep their same unit code (XD999); but the two single pass dryers did change and therefore would be recoded as YD999 for the 1994 report. The old codes (1D999 and 2D999) would remain in the database (Dryer A table) since they are necessary to describe those dryers during the 1989 tests.

(3) Test Codes - Test codes consist of a three digit facility code followed by a six digit number representing the test date and a final letter used to separate test codes with similar dates.

To illustrate, the above example will be expanded. Dryer 1D999 and Dryers XD999 were tested for particulate matter on October 31, 1989. Furthermore, Dryers XD999 were also simultaneously tested for VOC and were simultaneously tested at both the inlet and the outlet of the WESP. Table 2 shows how this information would be coded for the Reports Table.

TABLE 2 EXAMPLE OF TEST CODE ASSIGNMENT

TEST CODE	UNIT CODE	RUN NO.	SAMPLE LOCATION	FLOW (dscfm)	POLL 1	POLL 2
999-103189A	1D999	1	OUT	31,000	PM	
999-103189A	1D999	2	OUT	31,500	PM	
999-103189B	XD999	1	IN	101,000	PM	VOC
999-103189B	XD999	2	IN	110,000	PM	VOC
999-103189C	XD999	1	OUT	102,000	PM	VOC
999-103189C	XD999	2	OUT	109,000	PM	VOC

Note that there are three different test codes - one for Dryer 1D999's test and one each for the inlet and outlet test on Dryers XD999. Note also that PM and VOC samples were given the same test code since these pollutants were sampled for simultaneously.

D. Tables

(1) Introduction - The master database contains 23 tables, 21 of which are in three functional groups: "A" Tables, "B" Tables and Pollutant Tables. An overview of the function of each group, and the two other tables, was provided in Section III B. In this section the purpose and use of each table or group of tables will be discussed in more detail. Tables are described in the order in which they occur in the printed database(s). Column or field headings are explained in Appendix D.

(a) General Information Table - This table provides information on tree species generally used and the form in which the wood is received. The product column (field) is used to sort the database by panel type. The facility code provides a link to the Reports Table.

(b) Reports Table - This table is central to the database and contains all Test Code/Unit Code/Run Number combinations. The table contains basic stack gas parameters and a list of pollutants sampled for in each sample run. The Test Code/Unit Code/Run Number combination of this table will be the link to the "B" Tables and Pollutant Tables for a majority of the queries (questions) that are conducted.

(c) Dryer A Table - This table provides a description of the dryers that were tested. Fields (columns) such as Firing Type and Pollution Control Device contain information (criteria) that can be used to sort the database. In this table the Type Fuel field refers to fuels the dryer is capable of using or the fuel typically used. To sort records by type of fuel burned during the emission tests, the Type Fuel field in the Dryer B Table should be used.

(d) Dryer B Table - This table provides information about dryer operation and other process parameters during the testing period. Criteria such as wood species, type fuel, wood moisture content and dryer temperature can be used to segregate the data.

(e) Press A Table - This table provides general information on the presses that were tested. None of the presses in the database had pollution control devices (PCD) installed, thus PCD information is not included.

(f) Press B Table - This table provides information about the operation of the presses during the testing period. Numerous criteria are available for sorting the data, but data are scarce in some of the fields.

(g) Cooler A/Cooler B Tables - These tables serve the same purpose as the Press A/Press B Tables but describe cooler, rather than press, operations.

(h) Miscellaneous Equipment Table - This table provides information on units other than presses, dryers, boilers, coolers and unloaders. Codes for the types of miscellaneous equipment are provided in Section III C (1). Pollution control devices and general parameters such as wood species and temperature are provided.

(i) Unloader A/Unloader B Tables - These tables serve the same purpose as the Press A/Press B tables but describe unloader rather than press operations. Note that generally the unloader was considered part of the press, and unloader emissions were not separated. In some cases, however, the unloader emissions were considered separate in the stack test report. In this case, the emissions were kept separate in the database and comments were provided to alert the user.

(j) Pollutant Tables - These tables provide pollutant emission rates generally in several different units. All pollutant tables are identical in structure so that they can be combined or segregated as needed (by computer). Nine of the ten pollutant tables are pollutant specific. One, the Generic Table, contains information on all other pollutants. VOC data were converted to a carbon basis if provided otherwise. Nitrogen oxide data are provided on a NO_2 basis. In a very few cases, insufficient information was provided to determine the basis, and a NO_2 basis was assumed.

E. Structure of the Printed Database Tables

The database tables in Appendices A and B vary from small single page tables to large tables that span several pages horizontally and extend multiple pages vertically. Some of the large tables have hundreds of records (rows) and more than 20 fields (columns), and had to be printed on multiple pages.

The tables have a numbering system to help the user. Each database appendix has a table of contents to help locate the tables. Each table page has table-page-numbers as well as appendix page numbers. The first page of each table has a table-page-number after the title that describes the length and width of the overall table. For example, the first page of the table may have the descriptor Page 1a of 7 (a-c). This indicates that the table rows extend 7 pages "deep" and the table columns extend 3 pages across (a, b, and c). An individual record or row would be read across pages a, b, and c (for example, 2a, 2b, and 2c).

Black lines separating record groups are used to help the reader follow a record across the pages. For those tables that exceed two pages in width, repeated codes are used on the third (c) page as a reference point. ("A Tables" and the General

Information Table do not have record groups; codes are provided on all pages.)

For all tables except the "A Tables" and General Information Table, the records are provided in numerical order first by the Facility Code portion (first three digits) of the Test Code and then by the next six digits.

F. An Example of Database Use

(1) Introduction - An example is provided that may help the user understand how the tables are related. This section is intended for users of the printed database or spreadsheet users. Database software users should be able to query the database easily once the structure and links are understood.

(2) Example - Veneer Dryer VOC Data

(a) Step 1 - Turn to the Plywood VOC Table in Appendix B (last table). Select the records (rows) in which a "D" (for dryer) occurs in the Unit Code (total of 30 records). Record the Test Code, Unit Code and number of runs for each data set (total of 11 sets).

Note that data exist for three mills and seven different dryers (or combinations of dryers). Either record the emissions data or mark the place in the database.

(b) Step 2 - Open the Plywood Dryer B Table and search for the Test Code/Unit Code/Run Number combinations recorded from the Plywood VOC Table. Review and record pertinent data associated with each set of sample runs. For example, Dryer 2D179 was drying 100 percent pine veneer with a direct fired burner at temperatures of 420-484°F.

(c) Step 3 - Open the Plywood Dryer A Table and search for the seven dryer Unit Codes. Note that there are four direct fired dryers, two indirectly heated dryers and one radio frequency dryer. Note also that the radio frequency dryer receives redry only. Record the pertinent information associated with each Unit Code.

(d) Step 4 - Open the Plywood Reports Table and search for the Test Code/Unit Code/Run Number combinations from the Plywood VOC Table. Is any information pertinent or useful? Note the comments concerning flow measurement in the comments section.

(e) Step 5 - Return to the Plywood VOC Table or to the notes from that table. Compare the emission rates to the corresponding process data. Determine what process variables affect the emission rates. Determine which data are suitable for the existing need.

IV DATA NEEDS

A. Introduction

One purpose that a database can serve is to indicate areas in which data are lacking or scarce. Tables 3 through 7 in this section provide information on broad to relatively narrow categories of data contained in the OSB and plywood databases. These tables can be used as an aid when seeking information, but they can also be used to identify "gaps" or "weak spots" in the overall database.

This section will discuss data that are scarce or lacking in the Wood Products Database and not data that are scarce within the industry. Most of the data included in the Wood Products Database was obtained from a request for information made approximately 20 months ago. Since that time, a considerable amount of testing has been conducted. Additionally, only 53 of several hundred US panel plants responded.

General data needs for the entire Wood Products industry are discussed in the following section. Subsequently, specific needs for the plywood and OSB databases are discussed.

B. General Needs

Hardboard, roof insulation board, fiberboard sheathing, lumber and hardwood-plywood data are either completely lacking or not ready to be published at this time (with the exception of boiler data from some facilities manufacturing these products). Some hardboard process emissions data were received and a small amount of the data were usable, but a decision was made to initiate a second effort to solicit hardboard data and present the data separately in a future technical bulletin. Usable data were not received from the roof insulation board, fiberboard sheathing or "specialty fiberboard products" segments of the forest products industry. Similarly, data were not received from the hardwood-plywood and hardwood-lumber industries.

NCASI does have some softwood (mostly pine) lumber kiln emissions data. Most of these data were received in late December, 1994 and have not yet been processed and input into the database.

Emissions data accompanied by production information for miscellaneous small sources are needed. Very limited data on sanders, saws, planers, hammermills, refiners, formers, transfer cyclones, pneumatic conveying systems, etc. have been obtained. In many cases production data were not submitted with the stack test data and emission data were available only on a pound per hour basis. For most of these small sources the only pollutant tested for was front half or filterable particulate matter.

Additional data from press vents are needed. OSB is the only panel type for which a substantial amount of press data exists. Specific press testing needs are discussed by panel type in the following section.

Hazardous air pollutant (HAP) data are needed. The majority of HAP data (other than for formaldehyde) in the master database are from EPA sampling efforts at two particleboard mills and one MDF mill. The variability of some test results is such that they may be of questionable value. For some compounds, most of the sampling results are for only one type of source. For example, 21 of 25 phenol sample runs are from OSB presses or unloaders.

Emission test results from sources equipped with newer control technologies are needed. For example, there are no results for units controlled by Regenerative Thermal Oxidizers (RTOs) or biofilters in the database.

C. OSB Data Needs

More data were received from OSB mills than for any other type of mill (Table 3). The OSB database is reasonably diverse with respect to wood species, although dryer emissions data are needed for some northern and western softwood species (Table 4).

The vast majority of dryer particulate matter tests are from dryers controlled by wet electrostatic precipitators (WESP) (Table 5). About 25 percent of these data are from dryers controlled by electrified filter beds (EFB). Thus, further emission data from non-WESP-controlled OSB dryers are needed. Also, PM_{10} data from non-EFB-controlled OSB dryers are needed. A problem exists with respect to using existing EPA PM_{10} test methods on these high moisture sources, and good test data may be difficult to obtain.

All of the OSB dryer data in the Generic Table are from a single dryer tested with a single test method for aldehydes and ketones. Thus, HAP data for compounds other than formaldehyde for OSB dryers are needed.

The press data are reasonably well distributed among the ten database pollutant categories (Table 3). The major needs appear to be press PM_{10} data and HAP data. Sixty-eight formaldehyde runs, 15 MDI runs, 19 phenol runs and six naphthalene runs are in the database for OSB presses. No other OSB press data for HAPs were submitted.

D. Plywood Data Needs

The plywood database is approximately one-third the size of the OSB database and much less diverse. The available data are from only nine softwood plywood plants, with information for 12 dryers and four presses at these plants (Table 6). Additional data are needed for plywood plant dryers and presses since the

Further Subdivision - Dryers and Wood Species

POLLUTANT	WOOD SPECIES	NO. OF RUNS
Condensible Particulate Matter (CPM)	100% Douglas Fir	30
	Spruce/Fir Mix	6
	Douglas Fir/White Fir Mix	3
	100% Pine	19
Volatile Organic Compounds (VOC)	100% Douglas Fir	4
	100% Pine	26

present database does not provide an adequate representation of the softwood plywood industry.

No data were received from hardwood plywood mills. The wood species represented by the softwood plywood mills are reasonably diverse for the various particulate matter categories. For VOCs, there are 26 pine sample runs and four Douglas fir (Table 7). Since wood species has a major effect on VOC emissions, more VOC data are needed from non-pine veneer dryers.

Press data for plywood facilities are critically needed. VOC is the only pollutant category for which more than six press sample runs exist.

V CONCLUSIONS

The Wood Products Database is not a finished product but represents the first step of a broad-based effort to compile and organize air emission data for the wood products industry. In computer terms, it might be thought of as "Version 1.0."

At this point the database size appears to be much greater than its diversity. For example, hundreds of dryer particulate matter samples are compiled, but there are no data for methanol from either dryers or presses. The database contains 33 condensible particulate matter runs for OSB dryers drying poplar but absolutely no data for hardwood plywood processes. Other examples could be given, the point being that the amount of data is reasonably large, but the diversity needs to be improved.

More data are needed to improve the database. Diversity of sampling results should increase with the addition of newer sampling data, since the 1994 and 1995 testing, compared to past sampling, has been much broader in scope. Participation from additional mills would also improve the database. It is hoped this report and the availability of the computerized database will stimulate increased participation from the industry.

Industry support needs to continue for the database to continue growing in size and value to the industry. Mills who have (or will have) test data that will fill needs identified in Section IV are urged to submit that data for incorporation into the database. Mills who have not yet participated are also urged to submit data and not rely on "other mills'" participation. Cooperation and teamwork are needed for the future success of this project.

OSB - DRYER A TABLE, Page 1b

Unit Code	Recy-cled ?	Initial PCD	Interm. PCD	Final PCD	Q/C ?	Comments
1D069	N	CYC	CYC	WESP	Y	Primary and secondary cyclones; quench chamber operates prior to WESP.
1D070	N	CYC	MCLO	WESP	Y	
1D088	N	CYC	MCLO	EFB	N	
1D096	N	MCLO		EFB	N	
1D097	N	CYC		MCLO	N	Subsequently coded as XD097 when combined with 2D097 to a common EFB.
1D127	N	MCLO		EFB	N	
1D174	N	CYC	CYC	EFB	N	
1D210	N	CYC	MCLO	EFB	N	
1D211	N	MCLO		EFB	N	
1D212	N	MCLO		EFB	N	
1D225	N	MCLO		EFB	N	
2D069	N	CYC	CYC	WESP	Y	Primary and secondary cyclones; quench chamber operates prior to WESP.
2D070	N	CYC	MCLO	WESP	Y	
2D096	N	CYC	MCLO	WESP	N	Same dryer as 1D096 but with a WESP.
2D097	N	CYC		MCLO	N	Subsequently coded as XD097 when combined with 1D097 to a common EFB.
2D127	N	MCLO		EFB	N	Same as 1D127 but different location.
2D174	N	CYC	CYC	EFB	N	Comparison between fuels for this dryer in database.
2D211	N	MCLO		EFB	N	
3D070	N	CYC	MCLO	WESP	Y	
3D211	N	MCLO		EFB	N	
XD041	N			WESP	Y	Three dryers given one description.
XD044	N	CYC		WESP	Y	2 Dryers.
XD052	N			WESP	Y	4 Dryers with common stack; boiler flue gas provides heat.
XD083	N	MCLO		EFB	N	2 Dryers with 1 stack.
XD097	N	MCLO		EFB	N	Originally 1D097 and 2D097, combined to vent to a single control device.
XD215	N	CYC		WESP	Y	4 Dryers, 4 Cyclones, 1 Pre Quench, 1 WESP, 1 stack.
YD083	N	MCLO		EFB	N	2 Dryers with 1 stack.
YD215	N	CYC		WESP	Y	2 Dryers with common stack.

PLYWOOD - DRYER A TABLE, Page 1b

Unit Code	Burner Capacity (MMBtu/hr)	Type Fuel 1	Type Fuel 2	Recy-cled ?	Initial PCD	Interm. PCD	Final PCD	Q/C ?	Comments
1D149	14	SDUST		Y			WESP	Y	Raw heat return air injected back into system at blender box.
1D176		WREF							Roller jet veneer dryer; 1/6 inch veneer; target less than 18% redry; target moisture 12%.
1D178							WESP	Y	Indirectly heated with steams.
1D179		NGAS		N				Y	Dryer has 4 heating zones with one stack each; cooling zone also has separate stack (tested).
2D149	14	SDUST		Y			WESP	Y	Raw heat return air injected back into system at blender box.
2D176		WREF							This dryer receives redry only.
2D179		WREF		N				N	In one test, stacks not tested; flows estimated.
XD176		WREF							2 platen dryer with common stack; they are treated as one dryer; final moisture 14%.
XD203		STEAM		N			WESP		3 Dryers with a common stack.
XD222	30	WREF		Y				N	Two dryers with a common stack.
YD203		STEAM		N			WESP		3 Dryers with common stack. Exhaust from dryer are mixed with incoming combustion gas to provide temperature of 350 - 400 F.
ZD218				N			WESP		3 Dryers + Boiler vent to WESP; Longitudinal Reverse Air Veneer dryers; boiler gases and emissions included in all pollutant values.

TABLE C-3 DRYER TYPE CODES

CODE	DEFINITION
JET	Jet
LFLOW	Longitudinal Flow
PANEL	Panel
PLAT	Platen
RFREQ	Radio Frequency
RSP	Rotary Single Pass
RTP	Rotary Triple Pass
RU	Rotary Unspecified
TUBE	Tube Type

TABLE C-4 FUEL TYPE CODES

CODE	DEFINITION
MDF	MDF Scraps
DFINE	Dry Fines, Unspecified. May or May Not Contain Resin.
STEAM	Steam
TRIM	Trim
SDUST	Sanderdust
NGAS	Natural Gas
WREF	Wood Refuse or Wood Waste, Unspecified. May or May Not Contain Resin.
BARK	Bark
OIL	Oil
SAWD	Sawdust
FINES	Fines, Unspecified. May or May Not Contain Resin.
WDUST	Wood Dust, Unspecified. May or May Not Contain Resin.
BSG	Boiler Stack Gas

TABLE C-5 POLLUTANT CODES

CODE	DEFINITION
111-T-CH-E	1,1,1-Trichloroethane
124TMBENZ	1,2,4-Trimethyl Benzene
2-5-DMBENZ	2,5 Dimethyl Benzaldehyde
4-M-2-PENT	4-Methyl-2-Pentanone
44METDIAN	4,4 Methylene Dianiline
A-PINENE	Alpha Pinene
A-TERPENE	Alpha Terpeneol
ACETALD	Acetaldehyde
ACETONE	Acetone
ACETPH	Acetophenone
ACROLEIN	Acrolein
ACRYLNIT	Acrylonitrile
ALD/KET	Aldehydes/Ketones (Generally from Method 0011)
B-PINENE	Beta Pinene
BENZALD	Benzaldehyde
BENZENE	Benzene
BIPHENYL	Biphenyl
BIS-2EH-PH	Bis-(2-Ethylhexyl Phthalate)
BROMOMET	Bromomethane
BUTBENPHTH	Butylbenzyl Phthalate
BUTYLALDEH	Butylaldehyde
CARBDIS	Carbon Disulfide
CARBTETCHL	Carbon Tetrachloride
CHLOROFORM	Chloroform
CHLOROMET	Chloromethane
CO	Carbon Monoxide

TABLE C-5 POLLUTANT CODES (Cont'd)

CODE	DEFINITION
CO2	Carbon Dioxide
CPM	Condensible Particulate Matter, Back Half Only
CROTONALDE	Crotonaldehyde
D-N-BUT-PH	Di-N-Butyl Phthalate
DBM	Dibromomethane
DMS	Dimethyl Sulfide
ETYLBENZ	Ethyl Benzene
FOR	Formaldehyde
HAPS	"Catch All" Category, Generally Involves Testing for "Hazardous Air Pollutants"
HEXALD	Hexaldehyde
HYDROQUIN	Hydroquinone
ISOOCTANE	Isooctane
ISOVALALD	Isovaleraldehyde
M-P-XYLENE	m,p Xylene
M-TOLALD	m-Tolualdehyde
MDI	Methylene Bisphenyl Isocyanate
MEK	Methyl Ethyl Ketone
METH	Methane
METHENECHL	Methylene Chloride
N-BUTYRALD	N-Butyraldehyde
N-HEXANE	N-Hexane
NAPHTHALENE	Naphthalene
NITROBENZ	Nitrobenzene
NOX	Nitrogen Oxides
O-TOLALD	o-Tolualdehyde

TABLE C-5 POLLUTANT CODES (Cont'd)

CODE	DEFINITION
O-XYLENE	o-Xylene
P-CYMEME	p-Cymene
P-TOLALD	p-Tolualdehyde
PHENOL	Phenol
PM	Particulate Matter, Filterable Particulate, Front Half Only
PM10	PM10, Particulate Matter less than 10 Microns
PM10&CPM	Particulate Matter less than 10 Microns, Includes Condensible Particulate Matter (Back Half)
PROPIONALD	Propionaldehyde
SO2	Sulfur Dioxide
STYRENE	Styrene
T-FL-METH	Trichlorofluoromethane
T1-4-DCBUT	Trans 1,4 Dichlorobutene
TOLUENE	Toluene
VALALD	Valeraldehyde
VINYLACET	Vinyl Acetate
VOC	Volatile Organic Compounds, Sometimes Called TOC or THC

TABLE C-9 STACK TEST METHOD CODES

CODE	DEFINITION
?	Unknown, Method Not Provided in Submittal
G5T	Georgia 5T (Similar to ODEQ-7)
M0010	SW-846 Method 0010, Often Termed Semi-VOST or MM5
M0011	BIF Method 0011, for Aldehydes and Ketones, 40 CFR 266 Appendix IX
M0030	SW-846 Method 0030, Termed VOST, Volatile Organic Sampling Train
M1	EPA Method 1
M10	EPA Method 10
M10B	EPA Method 10B
M18	EPA Method 18
M2	EPA Method 2
M201/201A	Modification of Method 201A
M201/202	EPA Methods 201 and 202, PM10 Front and Back Half
M201A	EPA Method 201A
M201A/202	EPA Methods 201A and 202, PM 10 Front and Back Half
M201A/OD7	EPA Method 201A with ODEQ 7 Back Half
M202	EPA Method 202
M25	EPA Method 25
M25A	EPA Method 25A
M25M	Modification of Method 25A
M3	EPA Method 3
M4	EPA Method 4
M5	EPA Method 5
M5/202	EPA Methods 5 and 202, Front and Back Half

TABLE C-9 STACK TEST METHOD CODES (Cont'd)

CODE	DEFINITION
M5/OD7	EPA Method 5 with ODEQ Method 7 Back Half
M5A	EPA Method 5A - Back Half
M5X	EPA Method 5 Type Train with NaOH in the Impingers
M6	EPA Method 6
M604	Method 604 (Phenol)
M7C	EPA Method 7C
M7E	EPA Method 7E
MGC	A Gas Chromatographic Method, Unspecified
MM0011	Modified BIF Method 0011
MM5	A Modification of Method 5
MN3500	Modified NIOSH 3500
N347	NIOSH P&CAM 347
N3500	NIOSH Method 3500
NM1501	NIOSH Method 1501
OD5	ODEQ 5
OD7	ODEQ 7
OD8	ODEQ 8
P&CAM125	P&CAM 125
TO-11	TO-11 (Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air)
TO-5	TO-5 (Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air)
TO-8	TO-8 (Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air)

TABLE C-10 WOOD MATERIALS FORM CODES

CODE	DEFINITION
CHP	Chips
DCHP	Debarked Chips
FIBR	Fiber
LOG	Logs
LUMB	Lumber
PSHAV	Planar Shavings
SAWD	Sawdust
SF	Strands or Flakes
SHAV	Shavings
SKERF	Saw Kerf
TRIM	Trim
VENE	Veneer
WTC	Whole Tree Chips

TABLE C-11 WOOD SPECIES CODES

CODE	DEFINITION
ASPEN	Aspen
DFIR	Douglas Fir
GUM	Gum
HWOOD	Unspecified Hardwood
LARCH	Larch
LOB P	Loblolly Pine
LODGE P	Lodgepole Pine
MAPLE	Maple
OAK	Oak
PINE SP	Unknown Pine Species (Specific Information Not Provided)
POND P	Ponderosa Pine
POPLAR	Poplar
REDW	Redwood
SPRUCE	Spruce
SWOOD	Unspecified Softwood
SY PINE	Southern Yellow Pine (Mixed or Unspecified Southern Pines)
UFIR	Unspecified Fir
UWOOD	Wood from Urban Recycling Plant
WFIR	White Fir
HEM	Hemlock

APPENDIX D

GLOSSARY AND COLUMN HEADINGS

APPENDIX D

GLOSSARY AND COLUMN HEADINGS

% Free Formaldehyde - Best defined as percent free formaldehyde as determined by Wood Adhesives Manufacturers Technical Association (WAMTA) Methods 10.1 and 11.1.

% Fuel - Provides information on the percentage of total heat input supplied by the fuel (specified in the column to the left).

% Species - The approximate percentage of each wood species referred to in the previous column.

Amount Fuel - Provides information on the amount of fuel (specified in the column to the left) that was combusted. Units are not consistent and are specified within the column.

Any Catalyst or Scavenger? - A "Y" or "N" answer is provided to answer the question, "Are any catalysts or scavengers used?"

Application Rate - The rate at which the adhesive (specified in the column to the left) is applied. Units are inconsistent and specified within the column.

Board Density (lb/ft^3) - The density of the panel being pressed during the testing period.

Core and Surface Different? - A "Y" or "N" answer is provided to answer the question, "Is the resin type and application rate different for the core and surface layers?"

Core, Surface, or Both - A "C," "S," or "B" answer is provided to the question, "Is the dryer producing material for the core of the panel, the surface of the panel or both?"

Dryer Capacity - Information is shown as provided in mixed units. In some cases units were not provided. A strict definition of capacity was not given in the survey, therefore the basis for the given capacities is unknown (nameplate, maximum, etc.).

Dryer Type - General type or configuration of the dryer. Code definitions are provided in Table C-3 in Appendix C.

Fac Code - Facility Code. Three digit code assigned to each mill. The facility code is part of all test codes and unit codes associated with the specific mill.

Field - Database lingo for a column in a table.

Final PCD - Final Pollution Control Device. If only one control device exists, it is coded as a Final PCD. If two exist, they are coded as Initial and Final PCDs. If a series of three PCDs

exists, Initial, Intermediate and Final PCD columns are all used. Code definitions are provided in Table C-6 in Appendix C.

Firing Type - Provides broad categories for the means by which a dryer is heated. Code definitions are provided in Table C-2 in Appendix C.

Formaldehyde Mole Ratio - The mole ratio of formaldehyde to urea or phenol.

gr/dscf - grains per dry standard cubic feet.

Hot Air Source - Similar to Firing Type column in the Dryer A Table, but with more detail. For most purposes the Firing Type column in Table A will provide a more convenient means of segregating the data. The codes for this column (field) can be used when more detail is needed. Code definitions are provided in Table C-3 in Appendix C.

Initial PCD - Initial Pollution Control Device. If only one control device exists, it is coded as a Final PCD. If two exist, they are coded as Initial and Final PCDs. If a series of three PCDs exists, Initial, Intermediate and Final PCD columns are all used. Code definitions are provided in Table C-6 in Appendix C.

Inlet Moisture (% OD) - Provides information on the percent moisture of the wood feed at the process unit inlet, on an oven dry basis.

Inlet Temperature (F) - Provides information on the temperature, in Fahrenheit, at the inlet of the dryer.

Intermediate PCD - Intermediate Pollution Control Device. If only one control device exists, it is coded as a Final PCD. If two exist, they are coded as Initial and Final PCDs. If a series of three PCDs exists, Initial, Intermediate and Final PCD columns are all used. Code definitions are provided in Table C-6 in Appendix C.

lb/hr - pounds per hour.

lb/MMBtu - pounds of pollutant per million Btus of heat input.

lb/MSF ¾ - pounds of pollutant per thousand square feet of panel produced at a nominal thickness of 3/4 inch.

lb/MSF ⅜ - pounds of pollutant per thousand square feet of panel produced at a nominal thickness of 3/8 inch.

lb/ODT - pounds of pollutant per oven dry ton of wood material processed through the unit.

MMBtu/hr - Million Btus per hour heat input.

Moisture Content (%) - The moisture content of the wood material prior to entering the press. Basis unspecified.

Nominal Thickness (inches) - Provides information on the thickness of panel pressed during the testing period.

Number of (Press) Vents - Provides information on the number of vents or stacks through which the press, cooler or unloader releases emissions to the atmosphere.

ODTH - Oven dry tons per hour.

One to One? - A "Y" or "N" answer is provided to the question, "Is there one unit and one stack?" If the column contains a "Y" (for yes), conversion from a pollutant-mass-rate to a production-based-pollutant-rate was generally straightforward. If the column contains an "N," the conversion may not have been straightforward and assumptions may have been made. The user should check the comments column for information on assumptions.

Other Additives? - A "Y" or "N" answer is provided to the question, "Are additives other than wax, catalysts and scavengers used?"

Outlet Moisture (% OD) - Provides information on the percent moisture of the wood material at the process unit outlet, on an oven dry basis.

Outlet Temperature (F) - Provides information on the temperature, in Fahrenheit, at the outlet of the dryer.

Pollutant - Compound or group of compounds for which the test(s) were conducted. Code definitions are provided in Table C-5 in Appendix C.

ppm - parts per million.

Press Cycle Time (min.) - Provides the time, in minutes, for which the panels were pressed during the testing period.

Press Temperature (F) - Press operating temperature, in Fahrenheit, during the testing period.

Product - Panel type produced. Code definitions are provided in Table C-7 in Appendix C.

Production Rate - The production rate of the tested equipment as provided in report, on survey forms or as calculated. If (Units) are shown, the data provided in the column have inconsistent units and the unit is provided. Otherwise the units are specified. Unit explanations are included in this glossary.

Q/C? - A "Y" or "N" answer is provided to the question, "Is there a quench or cooling section for the dryer exhaust?"

Query - Database lingo for a structured question to be "answered" by the database.

Raw Wood Mat'l - Raw Wood Material. The form in which the mill receives its wood. Code definitions are provided in Table C-10 in Appendix C.

Record - Database lingo for a row of information in a table.

Recycled? - A "Y" or "N" answer is provided to the question, "Is any of the exhaust from the dryer recycled back into the burner or dryer?"

Run - The assigned sample run number.

Sam. Loc. - Sample Location. Provides information on the sample location relative to a control device. IN indicates inlet to the control device. OUT indicates outlet from a control device as well as outlet to the atmosphere (for those cases in which a control device does not exist).

Size and Openings - Provides a description of the press area in feet and information on the number of openings. For example, 10 x 25 5 openings describes a press that is 10 feet wide, 25 feet long and has 5 openings.

Stack Flow (dscfm) - The air flow rate at the sampling point, provided in the unit of dry standard cubic feet per minute.

Stack Moisture (%) - The percent moisture (by volume) at the sample point.

Stack Temperature (F) - The temperature in Fahrenheit at the sample point.

Test Code - Please see Section III C. (3).

Type Adhesive - The type of resin or adhesive used during the testing period. Code definitions are provided in Table C-8 in Appendix C.

Type Fuel - Type of fuel burned by the particular unit. "A" Tables provide capabilities and general usage, "B" Tables provide specific run-by-run fuel information. Code definitions are provided in Table C-4 in Appendix C.

Unit Code - Please see Section III C. (2).

Wax Application Rate - The rate at which wax was applied. Units are inconsistent and specified within the column.

Wood Species - The type of wood used. The General Information table indicates wood type generally used at the mill. Run-by-run specific wood use is provided in the "B" tables. Code definitions are provided in Table C-11 in Appendix C.
