I. INTRODUCTION:

This report presents the results of two sets of Particulate Emission Tests conducted on July 17 and 18, 1975 at Marblehead Lime Company, Pleasant Gap, Pennsylvania.

The tests were requested by the Commonwealth of Pennsylvania Department of Environmental Resources.

The tests included four two-hour runs designed to measure average emission rates from two baghouses used to control the combined emissions from three separate rotary lime kilns. The lime kilns are used for the production of lime from limestone. All three kilns ran continuously at normal production rates throughout the testing period.

Witnessing the tests were Messrs. David Eish, Robert Fisher, and George Mentzer of the Commonwealth of Pennsylvania Department of Environmental Resources, and Frank M. Werderitsch of Marblehead Lime Company.

II. SUMMARY RESULTS

The two baghouse stacks tested are both divided into six sections. At the request of the Commonwealth of Pennsylvania Department of Environmental Resources corresponding sections (section 1) from Baghouse "A" and "B" were tested on the first day. On the next day a second set of tests were conducted in a similar manner on different sections (section 4).

Results of the four runs are reported below according to Pennsylvania Sampling - Testing Rules in pounds per hour and are compared with allowable mass emission rates for all three process kilns.

	Mass Rate of Emissions Pounds per Hour	Allowable Emission Pounds per Hour
Baghouse "A" Section 1	2.8	
Baghouse "B" Section 1	2.5	
Subtotal	<u>5.3</u>	
Total Emission from both Baghouses (Subtotal x 6 identical compartments)	<u>31.8</u>	<u>56.8</u>
Baghouse "A" Section 4	2.0	
Baghouse "B" Section 4	3.0	
Subtotal	<u>5.0</u>	
Total Emissions from both Baghouses (Subtotal x 6 identical compartments)	<u>30.0</u>	<u>58.9</u>
