RE: Request for Response and Meeting on SDWA Petition for Emergency Action in the Lower Umatilla Basin in Oregon

In January of 2020, a coalition of clean water, public health, and other public interest advocates submitted a Petition to the U.S. Environmental Protection Agency (“EPA”) calling for emergency action under § 1431 of the Safe Drinking Water Act (“SDWA”) to address dangerous levels of nitrate contamination and exposure in the Lower Umatilla Basin in Oregon.¹ After two and a half years, with no meaningful response or action from EPA and the problem only getting worse, the undersigned request that EPA promptly respond to the Petition and take appropriate action as outlined therein. Petitioners also request a meeting to discuss the emergency and give impacted community members the opportunity to meet with Regional Administrator Sixkiller.

I. Background

The Petition establishes that nitrate contamination in the Lower Umatilla Basin poses “an imminent and substantial endangerment to the health of persons,” justifying EPA action.² The Petition also establishes that the region’s mega-dairies and other factory farm operations are a leading source of this pollution that must be addressed.³ Yet, local and state authorities have proven unable or unwilling to take the measures necessary to deal with the problem and ensure safe

¹ Petition for Emergency Action Pursuant to the Safe Drinking Water Act § 1431, 42 U.S.C. 300i, to Protect Citizens of the Lower Umatilla Basin in Oregon from Imminent and Substantial Endangerment to Public Health Caused by Nitrate Contamination of Public Water Systems and Underground Sources of Drinking Water, included here as Attachment A.

² See Attachment A, at 20–22 (explaining that exposure to elevated nitrate levels in drinking water may lead to “adverse health risks including a variety of cancers, thyroid disease, ‘blue-baby syndrome,’ and reproductive and gestational problems” including miscarriages).

³ *Id.* at 15–20.

drinking water. The principal mechanism to address the contamination, the Lower Umatilla Basin Ground Water Management Area (“LUBGWMA”), has doubled down on the same voluntary compliance measures that have proven ineffective over the past three decades.⁴

Oregon’s inaction raises environmental justice concerns, as the area has many people of color and a “linguistically isolated” population.⁵ Additionally, local demographics include a significant concentration of children and pregnant people, who are especially vulnerable to nitrate exposure.⁶ Prompt federal action is needed to protect everyone in the Lower Umatilla Basin from these substantial public health risks.

II. EPA Emergency Action Remains Necessary

Nitrate contamination in the LUBGWMA is not improving, and it appears that meaningful action to address the imminent and substantial endangerment posed to people living and working there remains dangerously absent. First, Morrow County has declared a state of emergency and is uncovering yet more disturbing data showing nitrate contaminated drinking water wells in use by residents. Second, Oregon’s main tool for engaging with private well users and promoting domestic well safety, the Domestic Well Safety Program (“DWSP”), appears to have been shuttered due to a lack of funding. Finally, Oregon has not taken any steps to ensure that no new significant sources of nitrate contamination, such as industrial dairy operations, are allowed in the LUBGWMA. EPA should not leave these impacted communities to fend for themselves, forcing them to consider resource-intensive litigation under 42 U.S.C. § 300j–8 to protect their right to clean and safe drinking water. For these reasons, we urge EPA to take action in response to the Petition.

A. Morrow County has declared a state of emergency

On June 9, 2022, the Morrow County Commission unanimously declared a state of emergency in response to high levels of nitrate pollution in domestic wells.⁷ The state of emergency provides for water distribution and well testing kits to increase awareness about the contamination and provide immediate – but temporary – relief. In the absence of an adequate state testing and response mechanism, the County has partnered with a grassroots organization to conduct door-to-door well testing.⁸ But these methods are an expensive band-aid that can only provide temporary relief rather than address the nitrate contamination directly.

The emergency declaration reveals the desperate need for safer drinking water, but the County is still dependent on state authorities to address the causes of the nitrate contamination. The Oregon Office of Emergency Management specified that the declaration “does not grant immediate access

⁴ *Id.* at 24, 26.

⁵ See Attachment B. We include as attachments several documents EPA has produced in its ongoing response to a Freedom of Information Act (“FOIA”) request submitted by Food & Water Watch.

⁷ Monica Samayoa, *Morrow County Declares Emergency Over High Nitrate Levels in Wells*, OPB (June 10, 2022), <https://www.opb.org/article/2022/06/10/morrow-county-state-of-emergency-drinking-water-contamination-nitrate-levels/>. Morrow County Commissioner Chair, Jim Doherty, has spearheaded an effort to test more wells. EPA could request this new data from Morrow County to inform its own response as well.

⁸ See *id.*

to state funds or other resources” and that the emergency response should not supersede the LUBGWMA’s work, even though that work has proven insufficient.⁹ Additionally, the state of emergency has a limited geographic reach as the contamination extends beyond Morrow County’s borders. The state of emergency is an attempt to protect public health on the local level. It demonstrates the severity of the contamination but is limited geographically, financially, and strategically in what it can do and is therefore not a replacement for state or federal action.

B. Oregon appears unable to address the scope of the contamination

For people living in the LUBGWMA, nitrate contamination of the region’s underground sources of drinking water is especially concerning because many people may be drinking, or otherwise using, contaminated well water without essential treatment or even knowing the problem exists. The number, treatment status, and location of contaminated private wells is unknown because there appears to be no database or other comprehensive effort to assess the universe of domestic well owners.¹⁰ Oregon pointed to the DWSP as its primary means to address this issue when responding to EPA’s initial inquiries.¹¹ It was supposed to provide new data to the Oregon Health Authority (“OHA”) database and conduct outreach and education to individuals and other professional partners. Unfortunately, that program was declared dormant as of September 20, 2020, and there is no indication of another program or funding to replace it.¹² It appears that Oregon’s best hope of working to protect public health through education and testing is now defunct. Although OHA cited a failure to secure a federal grant for ending the DWSP program, Oregon has repeatedly refused to allocate adequate funds to address the issue. As an OHA official recently acknowledged, due to resource limitations “we have historically been unable to interact directly other than via our website, and through email and phone requests for information.”¹³

Federal intervention to address nitrate contamination has taken place in the broader region before, even where the contamination was less widespread than it is in the LUBGWMA. In 2012, EPA intervened with a consent decree to control the imminent and substantial endangerment of nitrate contamination in the Lower Yakima Valley after conducting a study, which found between 10 and 20 percent of private wells had nitrate concentrations that exceeded the national and state drinking water standard.¹⁴ A 2015 to 2016 data set found that 48 percent of the tested wells in the Lower Umatilla Basin exceeded the MCL, more than twice the rate of exceedances as in the Yakima Valley.¹⁵ As previously noted, Morrow County testing earlier this year again demonstrated

⁹ See *id.*

¹⁰ See Attachment C, at 2 (“There is a gap in the understanding of the extent to which individual wells are contaminated in this zone of known contamination. The State is unable to provide a count of the number of private wells in use for domestic supply, and does not know the number or percentage of the domestic wells contaminated with nitrates over 10 mg/L.”).

¹⁴ EPA, Lower Yakima Valley Nitrate Study Fact Sheet (Oct. 2012), <https://www.epa.gov/sites/default/files/2017-12/documents/lower-yakima-valley-groundwater-fact-sheet-october-2012.pdf>; Administrative Order on Consent, In re Yakima Valley Dairies, No. SDWA-10-2013-0080 (EPA, Region 10).

¹⁵ See Attachment A, at 12.

high rates of well contamination.¹⁶ The imminent and substantial endangerment found in the LUBGWMA is evident and necessitates federal action to ensure residents are informed and have access to safe drinking water.

C. Oregon is preparing to allow additional nitrate pollution sources in an already contaminated and high-risk area.

Not only is Oregon not doing enough to address the existing nitrate emergency, it is poised to greenlight additional sources of nitrate contamination in the area. Although not yet issued, the state is in the process of developing a permit for Easterday Dairy, a proposed 28,300 cow mega-dairy that would be located in the LUBGWMA.¹⁷ Despite the enormous amounts of nitrogen-laden waste a facility like this would produce and dispose of locally, Oregon refuses to implement a moratorium on new mega-dairies that would stop Easterday Farms and similar proposals. In fact, environmental clean-up of the previous mega dairy in that location was declared finished despite a water quality advisory issued for nitrate contamination still on the site.¹⁸ Furthermore, Easterday Dairy has not even brought animals to the site yet but has incurred eleven water quality violations under the cleanup plan it inherited from the previous operators.¹⁹ Despite this alarming start, Oregon may still allow the mega-dairy to go forward. By considering allowing additional nitrate pollution in an area already dangerously contaminated, it is clear that Oregon is unwilling to take the necessary regulatory measures to address root causes of the unsafe conditions in the LUBGWMA. EPA must step in to ensure these communities have access to safe drinking water and that the region's groundwater may begin to recover.

Conclusion

Due to the imminent and substantial dangers associated with nitrate pollution in the LUBGWMA and the lack of an appropriate response by state authorities, we urge federal intervention and ask EPA to respond to the Petition with emergency action as outlined therein to protect affected community members. We also request a meeting so that impacted community members can discuss their concerns and lived experiences with EPA.

I. INTRODUCTION

The undersigned Petitioners respectfully petition the United States Environmental Protection Agency (“EPA”) to exercise its emergency powers established in Section 1431 of the Safe Drinking Water Act (“SDWA” or “the Act”), 42 U.S.C. § 300i, to address groundwater contamination that has presented, and continues to present at ever-increasing levels, an imminent and substantial endangerment to the health of the residents of the Lower Umatilla Basin (“LUB”) in Oregon. This petition is based primarily on data that have been compiled by the Oregon Department of Environmental Quality (“DEQ”), the Oregon Health Authority (“OHA”), Oregon Department of Agriculture (“ODA”), Umatilla and Morrow County Soil and Water Conservation Districts, and the Lower Umatilla Basin Ground Water Management Area Committee (“LUBGWMA Committee”), all of which demonstrate that nitrate concentrations in public water systems and underground sources of drinking water have routinely exceeded both federal and state drinking water standards, putting the health of area residents at serious risk. Every methodology employed by Oregon officials confirms that not only have past, voluntary measures relied on by the State been unsuccessful at reducing nitrate concentrations in crucial drinking water sources to below federal and state standards, but also that the unambiguous and unabated trend is towards ever greater levels of nitrate contamination. Instead of changing tack based on these findings and mandating actions necessary to improve water quality, Oregon officials recently doubled down on their voluntary-only approach, as outlined in the now-operative Second Lower Umatilla Basin Groundwater Management Area Local Action Plan (“Second Action Plan”).¹

As explained in this Petition, the well-documented nitrate contamination of eastern Oregon’s LUB drinking water necessitates prompt and decisive EPA emergency action under the SDWA. Elevated levels of nitrate in drinking water is known to increase the risk of a wide range of very serious health problems, including birth defects, “blue-baby syndrome,” various cancers, thyroid disease, and other maladies.² This contamination poses an imminent and substantial threat to human health, and the problem is only getting worse. Despite Oregon applying for and being granted “primacy” under the SDWA, state and local officials have failed to do what is needed to remediate this contamination and instead have allowed nitrate concentrations in the area’s drinking water to rise over the span of three decades. Oregon officials have effectively abandoned their responsibility to protect Oregon’s citizens by merely repackaging their failed voluntary-only approach, which continues to put control in the hands of the very polluters that have turned a once pristine source of drinking water into a pervasive threat to human health. EPA is fully empowered under the SDWA to take emergency action to protect human health in the LUB given present circumstances.

Therefore, Petitioners request that EPA act to protect human health and effectuate the goals of the SDWA in the LUB. Specifically, Petitioners request that EPA, at a minimum, provide a safe alternative source of drinking water for the impacted communities so long as dangerous nitrate contamination persists, further monitor drinking water quality and identify the

specific entities and land use practices causing the contamination, and issue orders necessary to begin reducing nitrate loadings and eventually return the area's underground aquifers to a safe and drinkable condition.

II. INTERESTS OF PETITIONERS

Food & Water Watch (“FWW”) is a national, nonprofit membership organization that mobilizes regular people to build political power to move bold and uncompromised solutions to the most pressing food, water, and climate problems of our time. FWW uses grassroots organizing, media outreach, public education, research, policy analysis, and litigation to protect people's health, communities, and democracy from the growing destructive power of the most powerful economic interests.

Columbia Riverkeeper's (“Riverkeeper”) mission is to protect and restore the water quality of the Columbia River and all life connected to it, from the headwaters to the Pacific Ocean. Riverkeeper works with people in dozens of communities—rural and urban—with the same goals: protecting the health of their families and the places they love. Riverkeeper enforces environmental laws to stop illegal pollution, protect salmon habitat, and challenge harmful fossil fuel terminals. Riverkeeper uses policy advocacy, litigation, and community organizing, partnering with Columbia River communities to protect clean water.

Eileen Laramore in her individual capacity. Ms. Laramore is a resident of Umatilla County who has a long history of engagement in the area. Her activities in Umatilla County include: founder and Executive Director of Friends of the Oxbow Property, Umatilla County, which works on a 222-acre restoration site on the Umatilla River near Hermiston, Oregon; founder and Executive Director of Tour of Knowledge, a grassroots citizen group that toured area facilities and sites that affected regional natural resources (disbanded in 2017); Master Gardner in Marion and Umatilla counties; and member of Friends of the Columbia River Gorge. Ms. Laramore also has an extensive history of civic service in the area that includes being Public Representative on the Umatilla Basin Critical Groundwater Area Task Force; Co-Chair of the Rural, Residual and Open Spaces Committee for the Lower Umatilla Basin Groundwater Management Area; Board Member on the Umatilla County Invasive Weed Committee (represented Hermiston, Oregon); and an attendee of Oregon Hanford Cleanup board meetings for two years.

Friends of Family Farmers (“FoFF”) is a grassroots, nonprofit organization based in Oregon with more than 8000 supporters from across the state. FoFF brings together farmers and citizens to shape and support socially and environmentally responsible family-scale agriculture in Oregon. We build a strong and united voice for Oregon's independent family farmers, food advocates, and concerned citizens who are working to foster an approach to agriculture that respects the land, treats animals humanely, and sustains local communities. It is our belief that every person — urban and agrarian, farmer and eater — has the ability to make choices that can help regenerate our food system.

Humane Voters Oregon (“HVO”) is an Oregon non-profit organization advocating in Oregon's political process and elections for improved animal welfare. HVO also participates in

selected administrative and legal proceedings, and promote policies, that improve human health and the environment while also improving animal welfare.

WaterWatch of Oregon protects and restores natural flows in Oregon rivers and advocates for wise and equitable management of all Oregon water resources, including groundwater.

The Animal Legal Defense Fund is a national nonprofit organization founded in 1979 in Cotati, California. ALDF's mission is to protect the lives and advance the interests of animals through the legal system. Advocating for effective oversight and regulation of CAFO development, expansion, and pollution across the United States is one of ALDF's central goals, which it achieves by filing lawsuits, administrative comments, and rulemaking petitions to increase legal protections for animals and communities affected by CAFOs. ALDF conducts this work on behalf of itself and more than 235,000 members and supporters throughout the United States, including over 50 in Eastern Oregon. Through these efforts, ALDF seeks to ensure transparency in the CAFO system, which is paramount to its ability to protect farmed animals and ALDF members from CAFOs' immensely harmful effects.

The Center for Biological Diversity ("the Center") is a non-profit, public interest environmental organization with more than 1.6 million members and online activists that is dedicated to the protection of native species and their habitats through science, policy, and environmental law. For decades the Center has worked to protect imperiled plants and wildlife, open spaces, and air and water quality, as well as to preserve the overall quality of life for people and animals. The Center and its members and supporters are concerned about the fate of imperiled species, including water-dependent species and their habitats, and alarmed by the increasing rate of extinction and loss of biological diversity across the United States.

Center for Food Safety ("CFS") is a national non-profit organization with a mission to empower people, support farmers, and protect the environment from industrial agriculture. CFS represents nearly 1 million members and supporters nationwide and tens of thousands in the Pacific Northwest, including Oregon. CFS uses education, policy and legislation, and impact litigation to address the negative effects to public health and the environment from harmful food production technologies, and supports ecological food production, like organic and beyond. CFS's regional program in the Pacific Northwest and Oregon specifically focuses on the negative impacts to community health, farmers, and wildlife from animal factories.

III. LEGAL BACKGROUND OF THE SAFE DRINKING WATER ACT AND EPA'S EMERGENCY POWERS

Congress enacted the SDWA as a powerful tool for protecting drinking water resources throughout the United States. Under the Act, EPA and state authorities are encouraged to work together to ensure access to safe drinking water. On the federal level, the SDWA "requires EPA to protect the public from . . . drinking water contaminants."³ States may apply for and EPA may grant "primacy" to states, which shifts significant authority and responsibility to state officials to

³ *City of Portland v. EPA*, 507 F.3d 706, 709 (D.C. Cir. 2007).

implement the SDWA.⁴ To assume primacy, the state is supposed to adopt regulations at least as stringent as EPA's national requirements, develop adequate procedures for enforcement and levying penalties, conduct inventories of water systems, maintain records and compliance data, and develop a plan for providing safe drinking water under emergency conditions.⁵ While a state granted primacy has responsibility to implement the SDWA's provisions in that state, EPA retains emergency powers under Section 1431 of the Act to take actions necessary to abate imminent and substantial endangerment to the health of persons caused by drinking water contamination when state officials have failed to effectively do so on their own.

For EPA to exercise its Section 1431 authority, two conditions must be met. First, the EPA must have received "information that a contaminant which is present in or likely to enter a public water system or an underground source of drinking water, ... may present an imminent and substantial endangerment to the health of persons."⁶ Second, EPA must have received information that "appropriate State and local authorities have not acted to protect the health of such persons" in a timely and effective manner.⁷

The SDWA defines a contaminant as "any physical, chemical, biological, or radiological substance or matter in water."⁸ While this broad definition does not require a substance to be regulated under the Act in order to be classified as a "contaminant," nitrate is listed as a contaminant with an established maximum contaminate level ("MCL") of 10 mg/L.⁹ Establishing nationwide, health-based MCLs is central to EPA's role in protecting drinking water in the U.S. under the SDWA.¹⁰ An MCL is the "maximum permissible level of a contaminant in water which is delivered to any user of a public water system."¹¹ MCLs are promulgated after a determination by EPA based on the best available, peer-reviewed science and data that regulating the contaminant will reduce a threat to public health.¹²

An endangerment from a contaminant is "imminent" if conditions that give rise to it are present, even if the actual harm may not be realized for years.¹³ Congress intended that EPA's exercise of its emergency powers "must occur early enough to prevent the potential hazard from

materializing.”¹⁴ Courts have established that an “imminent hazard” may be declared at any point in a chain of events that may ultimately result in harm to the public.¹⁵ Information presented to EPA need not demonstrate that residents are actually drinking contaminated water and becoming ill to warrant EPA exercising its Section 1431 emergency authority.¹⁶ In other words, an actual injury need not have occurred for EPA to act, and to wait for such actual injury to befall the public would be counter to the protectionary intent behind the SDWA. Thus, while the threat or risk of harm must be “imminent” for EPA to act, actual and documented harm itself need not be.¹⁷ While endangerments are readily determined to be imminent where MCL violations expose sensitive populations to a contaminant, contaminants that lead to chronic health effects may also be considered to cause “imminent endangerment.”¹⁸ In such cases, it is appropriate to consider the length of time a population has been or could be exposed to a contaminant.¹⁹

An endangerment is “substantial” “if there is a reasonable cause for concern that someone may be exposed to a risk of harm.”²⁰ Congress determined that an endangerment may be regarded as sufficiently substantial where there is “a substantial likelihood that contaminants capable of causing adverse health effects will be ingested by consumers if preventative action is not taken.”²¹ As with imminence, EPA has made clear that actual reports of human illness resulting from contaminated drinking water are not necessary to establish substantial endangerment.²²

EPA granted Oregon primacy under the SDWA in 2009, and Oregon has promulgated a framework similar to EPA’s MCLs as well as threshold triggers pursuant to the Oregon Groundwater Protection Act of 1989.²³ These triggers, when met or exceeded at least partly because of nonpoint source activities, require the state to investigate and declare a “groundwater management area” (“GWMA”) to address the contamination.²⁴ For most contaminants, Oregon law sets the trigger level at 50% of the national MCL, but for nitrate contamination it established a less protective 70% threshold.²⁵ Therefore, when nitrate levels meet or exceed 7 mg/L (70% of the 10 mg/L MCL), Oregon officials are required to establish a GWMA.

Because water quality testing has consistently found concentrations of nitrates in excess of the state trigger level, Oregon officials designated the Lower Umatilla Basin Groundwater Management Area (“LUBGWMA”) in 1990.²⁶ The LUBGWMA “was established to allow for the identification and implementation of practices that will reduce nitrate loading and ultimately

reduce groundwater nitrate concentrations below 7 mg/L.”²⁷ The designation has remained in effect ever since because the state has been unable to reduce nitrate contamination to within safe levels.

Oregon also established the LUBGWMA Committee to accomplish the task of bringing the area’s drinking water back below the 7 mg/L trigger level. The Committee is an official body comprising local residents and government officials that represent certain interests within the basin,²⁸ and is responsible for implementation of Action Plans intended to achieve various goals that, if met, should bring water quality within target nitrate concentrations. DEQ designated the Morrow and Umatilla County Soil and Water Conservation Districts to lead development of the First Action Plan, and then the Morrow County Soil and Water Conservation District to develop the Second Action Plan.²⁹ The First Action Plan was finalized in 1997, and dictated LUBGWMA efforts for more than twenty years. The Second Action Plan, which Morrow County and DEQ finalized in early 2019, is now the operative Action Plan for the LUBGWMA.³⁰

Yet, even where, as in Oregon, EPA has granted a state primacy, it retains permanent emergency powers to abate present or likely contamination of public water systems (“PWSs”) or underground sources of drinking water (“USDWs”) when such contamination poses an imminent and substantial threat to human health and the state “ha[s] not acted to protect the health of [endangered] persons.”³¹

EPA’s Section 1431 authority extends to contaminated PWSs or USDWs that pose a threat to human health,³² including sources that supply private wells.³³ EPA defines a USDW as an aquifer or part of an aquifer “(1) [w]hich supplies any public water systems; or (2) which contains a sufficient quantity of ground water to supply a public water system; and (i) currently supplies drinking water for human consumption.”³⁴ A PWS is one that provides water for human consumption and “has at least fifteen service connections or regularly serves at least twenty-five individuals.”³⁵

Groundwater supplies almost all of the drinking water in the LUBGWMA, where numerous private wells and 59 public water systems serve tens of thousands of residents.³⁶ Therefore, these underground aquifers qualify as USDWs, and both the USDWs and PWSs in the area are within the purview of the SDWA.

³⁴ 40 C.F.R. § 144.3.

³⁵ 42 U.S.C. § 300f(4)(A).

³⁶ See DEQ Water Quality Division, Analysis of Groundwater Nitrate Concentrations in the Lower Umatilla Basin Groundwater Management Area 44 (Feb. 23 2012) (hereinafter “2012 Nitrate Report, App. C”) (included here as Appendix C) (noting that 58 of the 59 active public water systems rely on groundwater, and that the City of Hermiston is almost entirely supplied by groundwater but for one food processing operation that uses surface water).

To abate endangerment to human health that arises despite a state's efforts to curtail it, Congress authorized EPA, among other things, to issue "such orders as may be necessary to protect the health of persons who are or may be users of" the affected drinking water supplies and to commence civil enforcement actions against entities causing threats to public health by contaminating drinking water supplies.³⁷

IV. DRINKING WATER CONTAMINATION IN THE LUBGWMA CONSTITUTES AN ENDANGERMENT UNDER THE SDWA AND NECESSITATES EMERGENCY ACTION BY EPA

Widespread nitrate contamination of critical drinking water resources in the LUBGWMA is ongoing and is found at increasing concentrations with each new round of water quality testing. The region's hydrogeology, paired with pervasive nitrogen-intensive land use practices, has created a dangerous situation where tens of thousands of people are using and depending on drinking water that may be dangerously polluted. The cause of the ongoing endangerment is no mystery; Oregon officials know that large-scale animal agriculture and nutrient management practices in the LUBGWMA are primarily to blame for the region's nitrate problem.

EPA emergency action is necessary in the LUBGWMA because nitrate levels in the area's drinking water pose an imminent and substantial risk to human health, which Oregon officials have been unable or unwilling to remedy almost 30 years after becoming aware of the contamination.³⁸ Dangerous levels of nitrate pollution are present and are likely to increase in PWSs and USDWs absent emergency action by EPA. Congress enacted, and later strengthened, the SDWA so that EPA could protect public health in just these types of situations.³⁹ While state and local authorities have attempted to address nitrogen pollution through outreach, public education, and voluntary measures, the area's continually rising levels of contamination pose an increasing risk to public health, demonstrating that these actions are insufficient. Furthermore, Oregon's officials are in the process of permitting yet another massive concentrated animal feeding operation ("CAFO") in the LUBGWMA. This facility is likely to exacerbate the current public health crisis by introducing even more nitrogen pollution into the area.⁴⁰ Therefore, EPA action is appropriate and necessary.⁴¹

³⁷ Emergency Authority Guidance, App. B at Attachment 2.

³⁸ See, e.g., Second Action Plan, App. A at 26, 30, 33, 34, 36 (acknowledging that nitrate levels are generally on the rise and that the state has not met the First Action Plan's goals of reducing nitrate levels to within the standards required by EPA and Oregon law to protect human health).

³⁹ See 42 U.S.C. § 300i; P.L. 99-339, 100 Stat. 642 (extending EPA's emergency authority to cover contamination of USDW as well as PWS, and adding to the actions EPA can take to remedy imminent and substantial endangerments).

George & Margaret LLC*, 954 F.Supp. 2d 1151, 1154 ("EPA Administrator may 'take action necessary to protect the public's health from an imminent and substantial endangerment created by contaminants in a public water system or an underground source of drinking water'" (quoting *W.R. Grace & Co. v. EPA*, 261 F.3d 330, 338-39 (3d Cir. 2001))).

Fig. 1, Location and Boundaries of the LUBGWMA

A. The LUBGWMA’s Hydrogeology Makes the Area’s Drinking Water Particularly Vulnerable to Nitrate Pollution

The widespread groundwater contamination in the LUBGWMA can be attributed in part to the hydrogeology of the region, which is particularly susceptible to nitrate pollution. The principal aquifers of the LUBGWMA occur in alluvial sands and gravels, which overlie a sequence of basalt lavas collectively known as the Columbia River Basalt Group.⁴² The alluvial aquifer and two or three upper basalt aquifers are the principal sources of domestic and municipal drinking water in the basin.⁴³ Above these shallow aquifers lie porous, sandy soils, which are subject to high rates of permeability when exposed to moisture. While the region receives relatively low amounts of rainfall (only 8 to 10 inches annually), widespread irrigation of agricultural lands brings large volumes of water to these permeable soils, allowing contaminants to reach groundwater in a matter of months.⁴⁴ These conditions create a significant risk of nitrate leaching into and contaminating groundwater; 88% of the area has high or moderately high nitrate leaching potential under irrigated conditions.⁴⁵

⁴² Gerald H. Grondin et al., Hydrogeology, Groundwater Chemistry and Land Uses in the Lower Umatilla Basin Groundwater Management Area 1-9 (hereinafter “1995 Hydrogeology Report, App. D”) (included here as Appendix D).

⁴³ *Id.*

⁴⁴ *Id.* at ES-2-3.

⁴⁵ Second Action Plan, App. A at 11.

Fig. 2, Nitrate Leaching Potential in LUBGWMA⁴⁶

As noted by Oregon DEQ, these stark figures “highlight[] the vulnerability of the shallow aquifer to contamination.”⁴⁷ Once present in groundwater, nitrate can remain and accumulate in the aquifers for decades before eventually discharging into the Columbia River.⁴⁸

Pairing this vulnerability with nitrogen-intensive land use practices is an obvious recipe for disaster, and Oregon officials have consistently failed to take the situation seriously enough to remedy the ongoing and increasing threat to area residents.

B. The LUBGWMA Has a Well-Documented History of Nitrate Contamination in Its Groundwater

The LUBGWMA has an extensive and well-documented history of nitrate contamination in its groundwater aquifers, which are the sole source of drinking water for much of the area’s population of approximately 46,000 individuals.⁴⁹ Spanning 550 square miles of northern Umatilla and Morrow Counties, the region has been plagued with high nitrate concentrations dating back to at least the mid-1980s, when groundwater sampling first revealed the problem.⁵⁰ In response, DEQ designated the LUBGWMA in 1990 with the intention that it would address nitrate contamination and mitigate nitrogen pollution so that groundwater concentrations would fall below the 7 mg/L state trigger level.⁵¹ Unfortunately, the designation has not resulted in improved water quality as intended; to the contrary, dangerous levels of nitrates in drinking water persist, and are in fact increasing, in the LUBGWMA.

⁴⁸ 1995 Hydrogeology Report, App. D at ES-2.

⁴⁹ See 2012 Nitrate Report, App. C at Table 6-1; Second Action Plan, App. A at 8 (providing population estimates).

⁵⁰ 1995 Hydrogeology Report, App. D at ES-1 & 6.

⁵¹ Second Action Plan, App. A at 1.

Testing conducted in the 1990s found nearly a third (30%) of groundwater samples from monitoring wells exceeded the state trigger level.⁵² Samples from areas dominated by CAFOs and agricultural fields where CAFO waste is land applied were showing nitrate levels that reached and exceeded 70 mg/L⁵³ – seven times the 10 mg/L MCL for nitrate.⁵⁴ A 1996 study showed that 23% of the surveyed population were drinking private well water with nitrate concentrations over the 10 mg/L MCL.⁵⁵ Of the households with nitrate levels over the MCL, 72% were not taking measures to effectively remove the nitrates before human consumption.⁵⁶

More recent figures suggest that the problem has only worsened. The LUBGWMA Committee compiled the results of well sampling conducted in the region between 2015 and 2016 from a data set of 255 wells, and concluded that nearly half (48%) exceeded the 10 mg/L drinking water standard and nearly two thirds (60%) exceeded the 7 mg/L state trigger level.⁵⁷ In a separate survey examining just private domestic wells, the Committee found that 42% of the region’s domestic wells contained nitrate levels exceeding the safe drinking water standard.⁵⁸

In fact, DEQ found that some of the largest water systems in the LUBGWMA are not just susceptible to contamination, but already face substantial nitrate risks. In 2011, DEQ conducted a survey considering the factors influencing nitrate risks at the area’s PWSs, and examined the extent to which these systems were compromised. The report focused solely on Community and Non-Transient, Non-Community systems,⁵⁹ and found that at least ten LUBGWMA systems had substantial nitrate problems or risks.⁶⁰ The at-risk systems included Boardman, Hermiston, and Irrigon, three of the five municipal water systems within the region. In total, the known substantial risk systems serve approximately 25,023 LUBGWMA residents (58% of all residents served by public water systems in the LUBGWMA).⁶¹

⁵² 1995 Hydrogeology Report, App. D at ES-1 & 5. At the time of these initial tests, the Oregon trigger level was set equal to EPA’s MCL of 10 mg/L, but has since been adjusted to the more protective standard of 7 mg/L. *Id.* at ES-2.

Furthermore, Oregon officials have documented nitrate contamination in both public and private drinking wells used by residents of the LUBGWMA.

Fig. 3, Drinking Water Sources with Documented Nitrate Exceedances⁶⁴

Given that the region is and will remain particularly susceptible to groundwater contamination, this nitrate contamination in the LUBGWMA's drinking water will persist and is likely to get worse without significant changes to current, nitrogen-intensive land use practices.

C. CAFOs and Irrigated Agriculture Are the Dominant Land Use Activities and Are the Predominant Cause of Nitrate Contamination in the LUBGWMA

Two related land use activities make up the vast majority of nitrate pollution in the LUBGWMA's groundwater: CAFOs and irrigated agriculture.⁶⁵ The primary source of nitrogen in the LUBGWMA is the region's CAFOs.⁶⁶ There are currently ten permitted CAFO facilities—including one of the nation's largest dairy CAFOs—operating within the borders of the LUBGWMA.⁶⁷ Together, these permitted CAFOs have been housing over 148,000 animals, with state issued permits allowing expansion up to 179,000 animals.⁶⁸ For comparison, cows

⁶⁸ Derived from information obtained by Food & Water Watch from ODA, collected by ODA in 2018 and 2019. Data included here as Appendix H.

outnumber residents by a ratio of 3:1, and cows living in the area as of June 2019 were producing over 4.3 billion pounds of manure annually—516 times more than the human population of the area.⁶⁹

Over half of the land in the LUBGWMA is used to cultivate crops on irrigated fields.⁷⁰ CAFOs are also responsible for much of the nitrate leached from irrigated agricultural lands because much of this irrigated crop production is controlled by the area’s CAFOs (approximately 42,000 acres of crop and pasture lands),⁷¹ which are used to land apply animal waste generated at the CAFOs. Additionally, CAFOs sell or give away animal waste as fertilizer to other farmers as part of standard manure management practices.⁷² Oregon estimates that 90% of the animal waste from CAFOs in the LUBGWMA is land applied to irrigated agriculture.⁷³ In total, irrigated agriculture applies nearly 23 million pounds of nitrogen to fields each year.⁷⁴ According to Oregon officials, nitrogen loading from CAFOs and irrigated agriculture combined accounts for an estimated 82% of the nitrogen imported into the LUBGWMA, and 81.6% of the nitrate that leaches into the LUBGWMA’s vulnerable aquifers.⁷⁵

Table 3, CAFOs Operating in LUBGWMA⁷⁶

Facility	Designation	Date Permitted	Permitted Animals	Actual Animals
Beef Northwest Feeders	Large Concentrated	6/29/2009	38,500	42,046

In addition to these CAFOs, Oregon is moving towards permitting yet another massive dairy CAFO in the LUBGWMA that has the potential to bring up to 28,300 more cows to the area, along with over 173 million gallons of waste needing disposal annually (40,882,123.64 gallons of liquid manure; 44,224,120.52 gallons of solid manure/litter; and 88,172,845.714 gallons of wastewater).⁷⁷ The prevalence and proposed expansion of CAFOs and other livestock production in the LUBGWMA virtually ensures that contamination is likely to continue and worsen without a change in approach.

The reason CAFOs have such potential to introduce massive quantities of nitrogen into the environment and the LUBGWMA's drinking water is simple: managing and disposing of the overwhelming quantities of nitrogen-laden animal waste is an unavoidable part of their everyday operating procedures. Under these facilities' Animal Waste Management Plans ("AWMPs"), a requirement for coverage under Oregon's general Clean Water Act National Pollutant Discharge Elimination System (NPDES) permit for CAFOs in the state,⁷⁸ CAFOs typically manage the enormous amounts of animal waste they produce by storing it in "lagoons" or other storage facilities and then land applying it to nearby agricultural lands.⁷⁹ While Oregon's permitting of CAFOs ostensibly provides for conditions that restrain land applications to within appropriate agronomic rates,⁸⁰ data confirming widespread nitrate contamination tell a very different story. Oregon DEQ admits that the greatest increases in nitrate contamination it has found are on lands subjected to CAFO manure land applications. And the most recent data available show test wells on lands utilized by the state's largest dairy, Threemile Canyon Farms, contain nitrate levels over 60 mg/L.⁸¹ Oregon's AWMPs do not require CAFOs to monitor surface water or groundwater, even though monitoring is an exceedingly valuable tool in a situation like the one facing the LUBGWMA, unless the facility "discharges to waters twice in a 24-month period."⁸² Given that land application runoff is generally considered stormwater rather than a discharge, which ignores

⁷⁷ See Easterday Application to Register to the Oregon CAFO General Permit, at 3 (July 1, 2019) (hereinafter Easterday CAFO Application, App. J) (included here as Appendix J). Cubic feet converted to gallons using 1:7.48052 conversion ratio.

⁸¹ Second Action Plan, App. A at 33-34.

⁸² DEQ, Oregon's Nutrient Management Program at 14, App. K.

leaching into groundwater rather than runoff to surface water, CAFOs will rarely trigger this requirement.

CAFOs in the LUBGWMA have a history of causing concern about drinking water quality in the area. For example, the region previously was home to the Lost Valley Farm megadairy, which ODA cited for hundreds of violations of its Clean Water Act NPDES permit within 18 months of opening.⁸³ Oregon officials approved the facility despite DEQ and ODA acknowledging that the CAFO was “a new potential source of nitrate in the [LUB]GWMA.”⁸⁴ Among these violations were consistent, unauthorized discharges over the top of lagoon liners, repeated overflow of wastewater onto permeable surfaces, storage of wastewater in improperly lined and unlined lagoons, failure to install leak detection systems, and land application of waste exceeding agronomic rates.⁸⁵ The Lost Valley Farm dairy was permitted to house up to 30,000 cows, despite being sited on top of the LUB’s especially vulnerable groundwater aquifer and the area’s preexisting nitrate contamination problems.⁸⁶ In a display of apparent disregard for the implications of another Lost Valley Farm debacle, Oregon legislators rejected several pieces of proposed legislation designed to protect public health and avert a repeat of this kind of situation in the future.⁸⁷

This problem is not limited to Lost Valley Farms. DEQ employees’ analysis indicates that current practices at Threemile Canyon Farms, unrelated to any AWMP or permit violations, are likely contributing to the area’s nitrate pollution.⁸⁸ Yet the Second Action Plan does not require or even suggest any changes to Threemile Canyon’s or other CAFOs’ waste management practices.

Furthermore, DEQ only tracks the leaching potential of land-applied CAFO waste, and does not account for leaching directly from CAFO manure lagoons or other waste storage facilities. The lagoons that are used to store manure prior to land application can leach nitrogen-heavy waste into the underlying soil and subsequently the aquifers below. In fact, even when “properly” constructed according to standards set by the USDA’s Natural Resources

⁸⁸ Email from Phil Richerson, DEQ Nonpoint Source Hydrogeologist, to Don Butcher, DEQ (Feb. 14, 2017) (included here as Appendix Q) (obtained through an Oregon Public Records Law request).

Conservation Service and in compliance with Oregon requirements for storage of CAFO wastes, lagoons are actually *designed* to leak.⁸⁹

Even this is not the full story. DEQ acknowledges that nitrate pollution from CAFOs is higher than estimated because the state has not looked at or accounted for several additional ways that CAFOs contaminate the environment with nitrogen pollution.⁹⁰ These unaccounted for sources include the re-deposition of the approximately 50% of nitrogen excreted by CAFO animals that is lost to the atmosphere during waste handling and storage, and spills and leaks of animal waste (of which there are several documented cases).⁹¹ If DEQ had factored these other sources of nitrate pollution into its estimates, the agency acknowledges the nitrate contamination attributable to CAFOs would be even larger.⁹²

Thus, even while not fully accounted for, the unavoidable conclusion is that CAFOs and irrigated agriculture's use of CAFO waste are primarily responsible for nitrate pollution of drinking water in the LUBGWMA. The consequences of this failure to control CAFOs' contributions to elevated nitrate levels are shown by on-the-ground data and trends. For example, DEQ's 2012 Nitrate Report looked specifically at well samples from the Threemile Canyon Farms CAFO. Of the 15 wells examined, 13 had nitrate concentrations over the 10 mg/L MCL.⁹³ And unfortunately, the data trends show that nitrate pollution on lands receiving CAFO waste is only getting worse. The most recent sampling data from 2015 and 2016 found multiple wells located within CAFO land application areas with nitrate concentrations over 60 mg/L, and "[t]he single largest increase [of nitrate pollution] was at a CAFO monitoring well."⁹⁴

Yet, despite this stark and unavoidable reality, Oregon officials are moving towards approval of yet another massive CAFO in the LUBGWMA to replace the failed Lost Valley Farm.⁹⁵ The proposed new owner/operator of the site, Easterday Farms, intends to reopen the

⁸⁹ See, e.g., *Cnty. Ass'n for Restoration of the Envt. v. Cow Palace, LLC*, 80 F. Supp. 3d 1180, 1223 (E.D. Wash. 2015) ("even assuming the lagoons were constructed pursuant to NRCS standards, these standards specifically allow for permeability and, thus, the lagoons are *designed to leak*" (emphasis added)); EPA, EPA/600/R-04/042, Risk Assessment Evaluation for Concentrated Animal Feeding Operations 24 (May 2004) (noting that nitrate contamination can be caused by manure lagoons that are known to leak into groundwater for a variety of reasons); Food & Water Watch et al., Public Comments on Proposed NPDES Permit for Lost Valley Ranch Dairy CAFO at 11 (Aug. 4, 2016) (included here as Appendix R) (noting that even the engineers hired by Lost Valley Ranch estimated the potential for 1,480 gallons of leakage per day when using the most protective type of lagoon liners); NRCS, Agricultural Waste Management Field Handbook, Chapter 10 at 10D-4 (Aug. 2009), <https://www.wcc.nrcs.usda.gov/ftpref/wntsc/AWM/handbook/ch10.pdf> (last visited Nov. 5, 2019) (recognizing that even the more protective synthetic liners can only "reduce seepage," not eliminate it).

facility as another CAFO with up to 28,300 animals under a new NPDES permit.⁹⁶ If allowed to proceed as planned, the Easterday Farms CAFO will have the potential to introduce hundreds of millions of pounds of additional nitrogen-laden waste to the area⁹⁷—enough waste to fill over 262 Olympic sized swimming pools each year.⁹⁸ Operating a CAFO on this site “presents serious concerns for water quality and safe drinking water” because any new CAFO is a source of nitrates further endangering the area’s groundwater.⁹⁹ Being upgradient of a large part of the LUBGWMA, with five PWS and many private wells near the site, “any groundwater pollutant emanating from the dairy could potentially impact” these crucial sources of drinking water.¹⁰⁰ The Easterdays intend to land apply the animal waste to be generated at the CAFO to surrounding agricultural fields.¹⁰¹

As long as CAFOs and other agricultural operations are allowed to continue polluting the LUBGWMA with excessive nitrogen, the imminent and substantial endangerment to human health will continue and will only worsen, leaving local populations at ever increasing risk to their health in direct contravention of the SDWA.

D. Conditions in the LUBGWMA Constitute an Imminent and Substantial Endangerment to Human Health Under the SDWA

The present and increasing nitrate contamination in the LUBGWMA presents an imminent and substantial endangerment to human health because nitrate contamination creates a known and significant health risk and there is a reasonable cause for concern that individuals are and will be exposed to this risk at ever increasing concentrations.

1. Nitrate Contamination in the LUBGWMA Drinking Water Constitutes an Endangerment

Nitrate is plainly an endangerment to public health under the SDWA because EPA not only categorizes it as a “contaminant,”¹⁰² but as an “acute contaminant” known to pose significant health risks.¹⁰³ EPA previously found that nitrate levels above the MCL of 10 mg/L present an imminent and substantial endangerment to human health.¹⁰⁴ Drinking water

HEALTH 1557 (July 2018) (included here as Appendix V); Oregon Health Authority, *Nitrate in Drinking Water – Frequently Asked Questions* (included here at Appendix W).

¹⁰⁴ In the Matter of: Yakima Valley Dairies, SDWA-10-2013-0080, at 7 (EPA Mar. 19, 2013).

contaminated with nitrate has well-documented adverse health risks including a variety of cancers, thyroid disease, “blue-baby syndrome,” and reproductive and gestational problems.¹⁰⁵ EPA’s categorization of nitrate as an “acute contaminant” indicates that “one exposure can affect a person’s health,” and that “[t]oo much nitrate in your body makes it harder for red blood cells to carry oxygen.”¹⁰⁶

Moreover, nitrate-contaminated drinking water is especially dangerous for sensitive populations such as infants and pregnant women. High levels of nitrate in drinking water are “a serious health concern for infants and pregnant or nursing women,” and are known to cause methemoglobinemia, or “blue-baby syndrome,” a potentially fatal condition in which an infant’s skin turns blue from lack of oxygen in the blood.¹⁰⁷ Nitrate in water supplies has also been linked to spontaneous miscarriages and birth defects.¹⁰⁸

According to the census estimates for the LUBGWMA region, significant populations that are especially sensitive to nitrate—infants and pregnant and nursing women—reside in the LUBGWMA. Census data show that 12.3% of women between the age of 15 and 50 living in Morrow County gave birth to a child from 2016 to 2017.¹⁰⁹ Six and a half percent of the same demographic living in Umatilla County gave birth to a child between 2017 and 2018.¹¹⁰

Nitrate contamination is already present and will continue to be present at increasingly elevated levels in USDWs for the LUBGWMA without EPA action. The fact that a contaminant known to cause disease and illness is present at unsafe levels in the LUBGWMA’s private wells and PWS, which are used by tens of thousands of residents, demonstrates an unambiguous SDWA “endangerment.”

2. The Public Health Endangerment Is Imminent

Since the present contamination of the region’s drinking water is thoroughly documented, endangerment is clearly imminent. As explained above, an endangerment is “imminent” if conditions that give rise to it are present, even if actual harm has not already been documented in the contaminated area.¹¹¹

Unsafe levels of nitrate contamination in the LUBGWMA’s water supply were first identified over 30 years ago, and data trends indicate that nitrate contamination overall is increasing in the LUBGWMA, despite Oregon’s 20 plus years of implementing mitigation

measures meant to decrease nitrates under the GWMA designation. The greatest increases in nitrate levels have been found at wells located where CAFOs land apply their animal waste.¹¹² This further demonstrates that endangerment is imminent and that CAFO operations and the waste they introduce to the area are the primary culprit. This upward trend increases both the likelihood that individuals will be exposed to nitrate at harmful levels and the severity of those exposures. Oregon's Nitrate Report demonstrated that 55% of the wells tested showed increasing concentrations of nitrate.¹¹³

Finally, the endangerment caused by nitrate contamination in the LUBGWMA is imminent because the likely primary causes of the contamination—CAFOs and their high-risk waste management practices—are present and increasingly dominant in the area, with 10 permitted CAFOs already in operation and the Easterday Farms mega-dairy threatening to open in the near future. Of these 10 existing facilities, four are dairies and six are cattle feedlots. These CAFOs manage approximately 42,000 acres of crop and pasture land in the LUBGWMA where they dispose of animal wastes, and this is in addition to any non-CAFO owned irrigated agriculture lands that nonetheless utilize CAFO waste as fertilizer.¹¹⁴

Existing concentrations of irrigated agriculture and CAFOs in the LUBGWMA make clear that an endangerment to human health is imminent. Data collected over the span of decades confirm this. Oregon officials' plan to permit another 28,300 cow CAFO in the area atop a particularly vulnerable aquifer pushes the needle off the scale, leaving no question as to imminence.

3. The Public Health Endangerment Is Substantial

The health risks associated with nitrate contamination in the LUBGWMA constitute a substantial endangerment under the SDWA. Several PWSs and many private wells within the LUBGWMA have already been found to exceed drinking water standards for nitrate contamination, and thus residents of the LUBGWMA have been and are currently being “exposed to a risk of harm.”¹¹⁵ This alone demonstrates that the endangerment is substantial.

Moreover, because nitrate levels are on the rise in the LUBGWMA and the state's ineffective, voluntary-only plan remains practically unchanged, there is currently no realistic potential for fewer PWSs and private wells to be contaminated or contaminated at lower levels than they currently are, absent emergency action by EPA. Petitioners have reasonably concluded (and Oregon officials have themselves implied) that more people's drinking water will become contaminated over time, and that the level of contamination will continue to increase. These exposures constitute a serious risk of harm, indicating that the substantial endangerment that already exists will only become more substantial and in need of emergency EPA action.

¹¹³ See 2012 Nitrate Report, App. C at 5.

¹¹⁴ Second Action Plan, App. A at 62.

¹¹⁵ See SDWA Emergency Authority Guidance, App. B at 11 (explaining that an endangerment is substantial “if there is a reasonable cause of concern that someone may be exposed to a risk of harm”).

V. OREGON OFFICIALS HAVE FAILED TO ACHIEVE SAFE DRINKING WATER QUALITY DESPITE DECADES OF ATTEMPTING TO IMPLEMENT MITIGATION PLANS

EPA should exercise its emergency authority under Section 1431 of the SDWA because users of USDWs and PWSs in the LUBGWMA face imminent and substantial endangerment, and whatever action Oregon officials have taken or are taking is obviously not timely or effective.¹¹⁶

Nearly thirty years after designation of the LUBGWMA, the endangerment to public health has worsened. As of 2016, the area's USDWs were exhibiting increasing contamination trends, with nearly half (48%) of tested wells exceeding the federal standard and 60% of wells surpassing the state action level standard of 7 mg/L.¹¹⁷ Moreover, the threat extends to communities well beyond those living in purely agricultural areas: Oregon considers at least ten community and non-transient, non-community PWSs in the LUBGWMA, which serve approximately 25,000 residents, "substantial nitrate risks."¹¹⁸ More than half of the LUBGWMA population is at substantial risk from nitrate-contaminated drinking water, with a number of water systems testing positive for unsafe nitrate levels. Thus, Oregon officials are and have been fully aware of the ongoing threat to human health that exists in the LUBGWMA.

Oregon's agencies and officials have proven ineffective at dealing with this imminent and substantial endangerment. After designation of the LUBGWMA, the primary tools for bringing drinking water quality back within safe levels have been the LUBGWMA Committee's First and Second Action Plans. The Committee finalized the First Action Plan and began implementation in 1997.¹¹⁹ It finalized the Second Action Plan in 2019.¹²⁰

Several Oregon agencies have failed to execute their responsibility to address the LUBGWMA's dangerous nitrate problems. The Oregon Health Authority ("OHA") has primary responsibility for implementing the SDWA in Oregon.¹²¹ The Oregon Department of Environmental Quality ("DEQ") is responsible for regulating and addressing pollutants that affect waterways under the Clean Water Act. The Oregon Department of Agriculture ("ODA") is responsible for developing those portions of the GWMA's Action Plan that deals with farming practices.¹²² These agencies work together to implement drinking water protections in Oregon.¹²³ The LUBGWMA Committee is the body tasked with implementing and overseeing the Action Plans. While Oregon officials have clear authority to adopt the mandatory regulations necessary to solve this problem, they have consistently refused to take such action, instead relying on voluntary-only plans in the past and again in the Second Action Plan.

¹¹⁶ See *supra* Section III.

¹²¹ See ORS 448.277.

¹²² Second Action Plan, App. A at 6.

¹²³ *Oregon's Water Quality Programs Regulatory Overview* (included here as Appendix AA).

The Action Plans suggest, but do not mandate, practices that could begin to abate the ongoing endangerment to human health.¹²⁴ Since declaration of the LUBGWMA, state and local officials have been operating under the assumption that “once businesses, organizations, governments and individuals are aware of the environmental consequences of certain practices, they will seek alternatives to reduce the likelihood of groundwater contamination.”¹²⁵ Consequently, the LUBGWMA Committee has taken a purely “voluntary approach” to combatting groundwater contamination rather than implementing mandatory or regulatory measures to reduce nitrates in the area’s groundwater.¹²⁶ Additionally, while DEQ and the LUBGWMA Committee memorialized a number of mitigation goals, recommendations, and strategies in the 1997 Action Plan, Oregon allocated no funding to actually execute the Plan.¹²⁷ Instead, the state placed the implementation burden on local jurisdictions that were admittedly plagued by “resource constraints” and already “under great pressure to complete many mandatory activities prior to implementing voluntary and non-regulatory tasks.”¹²⁸ Oregon again has failed to provide a dedicated funding source for implementation of the Second Action Plan, instead merely noting several disparate potential funding sources that it encourages local and state agencies to seek out.¹²⁹

In addition to the tools available to DEQ and the LUBGWMA Committee, ODA has authority to address the pervasive nitrate pollution in the region, which it refuses to meaningfully implement. Under the Agricultural Water Quality Management Act,¹³⁰ ODA develops Agricultural Water Quality Management Area (“WQMA”) Plans and Rules.¹³¹ While Area Plans are “neither regulatory nor enforceable,” ODA’s Area Rules are regulatory and contain enforcement provisions. The Umatilla Agricultural WQMA, which the Second Action Plan points to for ODA authority to help improve water quality in the LUBGWMA,¹³² and the Willow Creek WQMA provide the operative set of Area Plans and Rules relevant to the LUBGWMA. The Umatilla Agricultural WQMA covers the eastern portion of LUBGWMA,¹³³ while the Willow Creek WQMA covers the western portion.¹³⁴ Both Area Plans rely on voluntary measures and refer back to the LUBGWMA’s Action Plan in circular, and predictably impotent, ways.¹³⁵

While the LUBGWMA’s Second Action Plan relies on the potential “regulatory backstops [in the form of WQMA Rules] to the voluntary efforts described in the area plans,” that “backstop” is no more than a paper tiger since the Area Rules lack any degree of specificity and have not been implemented in a manner that has reduced or could actually reduce nitrate

levels in the area. In fact, ODA is open about the fact that Area Rules, unlike actual rules, “don’t specify” how each agricultural landowner must avoid further contaminating drinking water.¹³⁶ The Area Rules for the Umatilla and Willow Creek Agricultural WQMA lay out cursory and generalized requirements that are supposedly enforceable by ODA, but given that drinking water contamination in the area has increased over time despite the Rules clearly shows their ineffectiveness. The Umatilla Area Rules purport to require that land application of nutrients, “including manure . . . , must be done at a time and in a manner that does not pollute waters of the state.”¹³⁷ The Willow Creek Area Rules lack even this vague requirement, instead requiring only that “irrigation must be done in a manner that *limits* the amount of pollutants in the runoff from the irrigated area or that leaches into groundwater.”¹³⁸ Thus, the Willow Creek Rules on their face *allow for* continued groundwater contamination. The Area Rules do not provide any requirements regarding how to avoid contaminating drinking water in this particularly vulnerable area, and their overarching mandates have never been enforced, as proven by data showing long-standing and increasing nitrate pollution to USDWs. Given the decades of dangerous nitrate contamination in the LUBGWMA, these two sets of vague and poorly-enforced WQMA Plans and Rules fall far short of what is needed, and far short of what would constitute action to protect public health precluding EPA from taking its own emergency action under the SDWA.

Without the necessary funding or regulatory mandates that are clear and enforceable, the First Action Plan was left largely unimplemented and predictably failed to bring nitrate levels within state and federal standards. The plan articulated eight goals to be met by December 2009, the most important of which was achieving a downward trend in nitrate levels throughout most of the region. Not only was this goal not met, even 10 years after intended, only three of the other goals were actually met. Additionally, of the eighteen recommended tasks, only five were implemented in full.

Table 4, Attainment of First Action Plan Goals¹³⁹

Goal	Status
Data indicates a downward trend in nitrate levels throughout most of the GWMA	Not Met
95% of irrigated acreage is implementing an accepted system of BMPs or are covered by an implementation plan and the recommendations are in place and being used	Not Met
80% of residents are still aware of the nitrate problem and are aware of at least one activity which contributes to the problem. 75% can cite at least one activity they have changed because of their awareness of the issue	Not Met
All local area governments can cite procedures, requirements, and/or practices they have instituted as a result of the GWMA declaration	Partially Met

¹³⁶ ODA, A Landowner’s Guide to Oregon’s Agricultural Water Quality Management Program 4 (included here as Appendix AD).

¹³⁷ OAR 603-095-0340(7)(a); OAR 603-095-2840; *see also* OAR 603-095-0340(2) & 603-095-2480(2) (cross-referencing to ORS 468B.25 (prohibiting any person from “[c]aus[ing] pollution of any waters of the state”) and 468B.050 (requiring facilities to obtain coverage under state water quality permits)).

¹³⁸ OAR 603-095-2840(5) (emphasis added).

¹³⁹ Second Action Plan, App. A.

Methods to address and reduce the impact of septic systems have been adopted in all areas considered high risk for nitrate loading from high densities of septic systems	Partially Met
Monitoring data show no violation of permit specific concentration limits imposed on Food Processors	Met
90% of CAFOs are implementing an accepted system of BMPs or are covered by an implementation plan	Met
The Umatilla Chemical Depot Washout treatment system is working as expected and reinjection water is not migrating beyond the capture zone of the treatment system	Met

Importantly, even though the goal that “90% of CAFOs are implementing an accepted system of [Best Management Practices] or are covered by an implementation plan” was met, the greatest increases in nitrate levels were found at test wells where CAFOs land apply manure, as discussed above. Thus, it appears that the referenced BMPs for CAFO’s manure management were unsuccessful at actually reducing or stopping the increase in nitrate contamination despite successful “implementation” at 90% or more of the area’s CAFOs. Despite this, “accepted BMPs” have not been strengthened by state agencies.

Now in 2019, after more than 20 years of voluntary-only BMPs and implementation measures failing to reduce nitrate levels or even stop the ongoing increases in nitrate concentrations, Oregon *again* refused to adopt a single mandatory measure to reduce existing or future nitrate pollution in the area’s groundwater. The Second Action Plan does not discuss this glaring fact, much less provide an explanation why Oregon officials believe more of the same will yield different results. At most, the Second Action Plan provides that “[i]f progress in implementing strategies (that lead to reductions [sic] the groundwater nitrate levels) is not accomplished” when the Committee conducts its annual assessments, it “*may* include mandatory actions or regulatory changes to address protection of groundwater.”¹⁴⁰

Tellingly, this is precisely what the First Action Plan said over 20 years ago in 1997: “If the voluntary approach does not result in satisfactory progress towards reducing nitrate contamination in the groundwater, mandatory requirements will be considered as part of the action plan. The Groundwater Protection Act (ORS 468.183) provides for inclusion of mandatory requirements as part of the action plan.”¹⁴¹ The First Action Plan also relied on ODA to take mandatory action if such action was “deemed necessary.”¹⁴² After 22 years, state and local officials have demonstrated their unwillingness to enact the mandatory measures required to end the endangerment to human health in the LUBGWMA, and have again kicked the can down the road indefinitely rather than taking necessary action.

This is not an abstract exercise in public-private partnership building that voluntary-only measures may help foster; real people have been expecting change, apparently in vain, for decades. As stated by the East Oregonian newspaper in 2004, “The [LUBGWMA] committee must submit an evaluation of its progress to the state every four years. As long as the group is

¹⁴⁰ Second Action Plan, App. A at 6 (emphasis added).

¹⁴¹ First Action Plan, App. Z at 8.

¹⁴² First Action Plan, App. Z at 6.

making improvements, water quality control stays in its hands. If the group is unable to encourage citizens to voluntarily solve water quality concerns, the state government will mandate what must be done.”¹⁴³ Then again in 2009, the East Oregonian wrote that, after testing data showed that nitrate contamination “remain[ed] stubbornly high” despite past voluntary efforts, new regulations and rules “concern[ing] how and when farmers apply nitrogen to their fields” may be necessary.¹⁴⁴ Over ten years later, with nitrate levels at all-time highs, meaningful action is necessary, and Oregon officials have proven themselves unable and unwilling to deliver.

Petitioners and those living in the LUB who rely on the area’s groundwater for everyday life can no longer depend on DEQ, OHA, ODA, or the local officials in charge of implementing corrective measures in the LUBGWMA to fix the ongoing and worsening endangerment to human health caused by nitrate contamination. Decades of objective failure to rein in nitrate pollution from the area’s CAFOs and irrigated agricultural practices have been left unaddressed by the now-operative Second Action Plan, which gives no more than a passing nod to the possibility of imposing the past due mandatory measures necessary to improve water quality. EPA must not let another 20 years pass as the problem continually gets worse and Oregon officials continue to sit on the sidelines while the threat to the health of Oregon citizens grows.

VI. EPA EMERGENCY ACTION IS NECESSARY TO ABATE ONGOING AND EVER-INCREASING ENDANGERMENT TO HUMAN HEALTH FROM NITRATE CONTAMINATION

EPA’s SDWA guidance states that if EPA knows state or local agencies are going to act, EPA must decide if the actions are timely and effective.¹⁴⁵ And if they are insufficient, EPA should proceed with emergency action necessary to protect human health.¹⁴⁶ EPA action is necessary here because although state and local authorities have taken various actions to try and address nitrate contamination in the LUBGWMA over the past decades, such as testing, monitoring, and establishing action plans, these actions have not been timely or effective.¹⁴⁷ State and local officials have failed to protect public health from nitrate contamination, and their latest plan doubles down on the failed voluntary-only approach. Meanwhile, other state actions such as the continued approval and permitting of CAFO operations with inadequate protections directly undermine any efforts at improving the region’s groundwater quality. The state has its head in the sand, and is only digging itself deeper. Thus, EPA has the authority to take emergency action because although the state and local agencies have already started to act, they have not done so in a timely or effective way.

¹⁴³ *Women Sound Nitrate Warning*, EAST OREGONIAN (Mar. 8, 2004) (included here as Appendix AE).

¹⁴⁴ *Stubbornly High Nitrate Numbers Could Lead to DEQ Regulation*, EAST OREGONIAN (Nov. 28, 2009) (included here as Appendix AF).

¹⁴⁵ See SDWA Emergency Authority Guidance, App. B at 9, 13.

¹⁴⁶ *Id.*

¹⁴⁷ See H.R. Rep. No. 1185, 93rd Cong., 2d Sess., 35-36 (1974) (discussing the legislative intent to “direct the Administrator to refrain from precipitous preemption of effective State or local emergency abatement efforts” unless action is not timely or effective); see also SDWA Emergency Authority Guidance, App. B at 9.

The endangerment in the LUBGWMA therefore meets all of the criteria for EPA action. As discussed in detail above, the statutory prerequisites for emergency action under 42 U.S.C. § 300i are satisfied here.¹⁴⁸ First, nitrate, which is a “contaminant” under the SDWA,¹⁴⁹ is present in and continues to leach into USDWs in the LUBGWMA. Moreover, nitrate contamination has been present in and continues to be a problem for LUBGWMA’s PWSs. Second, the presence of nitrate contamination in groundwater is causing an imminent and substantial endangerment to public health; an alarming number of LUB residents rely on USDWs and PWSs that have been identified as carrying substantial nitrate risks for users. Finally, neither the State of Oregon nor Umatilla and Morrow County Soil and Water Conservation Districts have taken timely or effective action to abate the public health endangerment. Though DEQ and ODA have taken some steps to investigate the nature and scope of the threat, Oregon officials have failed to exercise their authority to effectively regulate the predominant sources of contamination, instead relying on public outreach and voluntary measures that have consistently failed to protect groundwater quality from further deterioration. And while county and city authorities have engaged in public education and research related to groundwater quality, their limited action has similarly proven insufficient to remedy the problem.

EPA has broad authority to investigate and remediate threats to public health under the SDWA in these circumstances. “Once EPA determines that action under Section 1431 is needed, a very broad range of options is available” as necessary to protect users of USDWs.¹⁵⁰ The tools available to EPA include conducting studies, halting the disposal of contaminants that may be contributing to the endangerment, and issuing orders such as mandatory changes to manure generation, handling, and land application practices.¹⁵¹ In fact, “EPA may take such actions notwithstanding any exemption, variance, permit, license, regulation, order, or other requirement that would otherwise apply.”¹⁵²

EPA should prioritize investigating and abating nitrate contamination caused by CAFOs and land application of CAFO wastes to irrigated agriculture in the LUBGWMA. As explained, these interrelated land use activities constitute the vast majority of nitrogen pollution in the region—approximately 82%—and this contamination has degraded the area’s USDWs for decades.¹⁵³

Specifically, Petitioners request EPA take at least the following measures under its Section 1431 SDWA emergency powers:

- Supply a free source of clean drinking water to residents of the LUBGWMA whose wells or PWSs exceeds safe limits for nitrate;
- Conduct additional investigation and monitoring throughout the LUBGWMA to more accurately trace the sources and quantities of nitrate-nitrogen pollution, and

¹⁴⁸ See also SDWA Emergency Authority Guidance, App. B.

¹⁴⁹ 40 C.F.R. §§ 141.11(d); 141.62(b).

¹⁵² *Id.* at 9.

¹⁵³ See *supra* Section IV.C.

work to identify which CAFOs and manure management practices are causing nitrate contamination;

- Issue orders requiring CAFOs and irrigated agriculture land applying CAFO waste or other nitrogen fertilizers to modify their practices so that these operations will cease overburdening the area with nitrogen pollution via lagoon leaching, land application of manure, and/or spills and leaks;
- Issue an order prohibiting the proposed Easterday Farms CAFO or any other new CAFO from opening on the failed Lost Valley Farm site or elsewhere in the LUBGWMA unless and until nitrate concentrations in the area consistently fall below the established, health-based MCL of 10 mg/L;
- Investigate Oregon's BMPs for CAFO nutrient management to determine why they have been unsuccessful at protecting groundwater in the LUBGWMA and what more effective BMPs are necessary; and
- Determine what enforcement measures should be implemented to effectively reduce nitrogen pollution from these sources, and initiate those enforcement actions as soon as practicable.

VII. CONCLUSION

In conclusion, for the reasons and upon the bases stated above, the undersigned Petitioners respectfully request that EPA invoke its emergency authority under section 1431 of the Safe Drinking Water Act, 42 U.S.C. § 300i, to address the imminent and substantial endangerment to public health within the LUBGWMA caused by ongoing and increasing nitrate contamination. Please contact Tarah Heinzen by email at theinzen@fwwatch.org or phone at (202) 683-2457 with questions or for more information regarding this petition or the basis of our request.

Region 10 Briefing Paper -- Umatilla 1431 Petition 02/27/2020

Purpose: Brief ECAD Director to Inform, Receive Feedback & Obtain Decision to Proceed with Recommendations

- Summarize petition request & initial analysis conducted by Region 10
- Provide Initial Assessment/Recommendations
- Confirm Next Steps/Milestone(s) (briefings, meetings, and/or written communications)

Overview: Region 10 ECAD, WD and ORC are evaluating a petition from Food & Water Watch and 8 other organizations asking EPA to use authorities under SDWA 1431 to respond to nitrate exceeding drinking water standards in the Lower Umatilla Basin Groundwater Management Area in north central Oregon. The petition identifies CAFOs as a concern and provides 1500 pages of information to support their request, much of which is publicly available from the GWMA's efforts. The petitioners requested that EPA institute a moratorium on new CAFOs in the GWMA, and requests additional investigation, monitoring, enforcement, and provision of alternative drinking water. Region 10 is coordinating with OECA & OGC and making initial inquiries of state agency contacts for the GWMA at ODA, ODEQ and OHA as we evaluate the information submitted.

Key human health considerations that inform this briefing:

- Nitrate is an acute contaminant, meaning it can cause serious harm in hours or days at concentrations exceeding the 10 mg/L nitrate-N drinking water standard.
- The nitrate MCL is set to protect infants from methemoglobinemia, a condition in which oxygen is displaced in the blood. Infants are the most sensitive population because their digestive systems are underdeveloped. Methemoglobinemia if untreated can result in death.

Assessment/Recommendations

- The LUBGWMA estimates that 30-40 percent of residential drinking water wells exceed the MCL. However, the magnitude of current health exposure is unknown due to a lack of information about total number of residential wells, how many residential wells have point of use treatment or other safeguard, and the level of public awareness to test residential wells and take remedial actions based on those results, especially for vulnerable populations. EJ Screen tool demographics show high concentrations of children under four and English as a second language populations within the GWMA.
- Several of the individual (domestic or monitoring?) wells have had nitrate levels in the 20 to 40 ppm range, based on data collected from roughly 1992 through 2015/6 as part of the LUBGWMA efforts.
- A Second Action Plan (2019) generated by the LUBGWMA includes actions for 2020 to increase communication and awareness related to high nitrate levels in domestic wells. Based on EPA's initial assessment, **Ex. 5 Deliberative Process (DP)**
- Branch Chief-level meetings with program managers of ODEQ, OHA, & ODA are recommended for March 2020 to discuss the petitioner concerns, EPA's initial analysis **Ex. 5 DP / Ex. 7(A)**

Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

- The questions to ask should include Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

- In response to a request from ODEQ's project coordinator in the LUBGWMA, Region 10 (Winiacki) has agreed to provide a **presentation in April at LUBGWMA** related to EPA's work in the Lower Yakima Valley to control nitrate.
- **DISCUSS:** Whether Region 10 should Ex. 5 DP / Ex. 7(A)

Ex. 5 Deliberative Process (DP)

Timeline

January 16, 2020 – Food & Water Watch and 8 other petitioners ask EPA to take action in response to nitrates in drinking water in the LUBGWMA (eastern Oregon), citing lack of action since the GWMA began in 1990.

January 29, 2020 – R10 RA provided initial response acknowledging receipt and indicating that EPA would respond further when we have completed our review.

Feb 26, 2020 – Initial reviews complete, including contacts with ODA, OHA & ODEQ (primary state regulators) & consultations with OECA & OGC.

Proposed Next Step in March 2020 – schedule management-level (OOO Director, ECAD & WD Branch Chief) meetings with ODA (Stephanie Page, Director of Natural Resources and Wym Mathews, CAFO and Fertilizer Program Manager), OHA (e.g., Andre Orzo or Dave Emme) & ODEQ (Justin Green, Water Quality Division Administrator, Linda Hayes Gorman, Administrator of DEQ's Eastern Regional Office) to discuss Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

Initial Analysis

- Petition relies primarily on generally-accepted data contained in LUBGWMA reports that are not in dispute, including documented exceedances of nitrates in ground water resulting in widespread exceedance of MCL in both PWSs and private wells.
- The 2019 Second Action Report prepared by the LUBGWMA identifies additional public outreach actions to be undertaken in 2020 by Umatilla and Morrow Counties to inform/educate private well owners
- Region 10's review of Public Water Systems in the petition confirms that PWS's have had to drill new wells or install treatment to address nitrate exceeding the MCL. The petition does not clarify, but EPA has confirmed, that OHA has taken, or is taking, action as primacy agency for SDWA to address nitrate exceedances at PWSs.
- Region 10 has conducted limited review on the petitioner's claims regarding CAFO's specifically, or other sources of nitrates and exceedances across the GWMA area (covering Umatilla & Morrow counties). The GWMA covers 550 square miles and an estimated 46,000 individuals. The identified LUBGWMA

potential nitrate sources include: irrigated agriculture, land application of food processing industrial process wastewater, confined animal feeding operations as categorized sources of nitrates to ground water.

○

Ex. 5 AC / Ex. 7(A)

SDWA 1431 Legal Requirements

- There is no legal procedural requirement or timeline to provide a written response to the petition. However, OECA has counseled, **Ex. 5 AC/DP**
- EPA must determine there is an imminent and substantial risk, based on information, and that state/local authorities have not acted to (adequately) address the risk.
- Notwithstanding any other provision of SDWA, EPA may direct any person to take action necessary to protect public health from an imminent and substantial risk from a contaminant that may enter an USDW or public water system.

Summary of Initial Analysis

Region 10 staff, in consultation with OECA & OGC, have conducted an initial analysis of the information in the petition to assess whether there is an imminent and substantial endangerment and if so whether state and local authorities have acted to address it. OECA/ OGC stressed that ensuring notice to people potentially affected by residential wells is a key first issue.

Source

Concern: The petitioners are concerned about nitrate impacts from CAFOs and irrigated agriculture. Lost Valley Dairy is mentioned specifically, in addition to concern about a proposal to permit another dairy operation in the same location.

Assessment: Region 10 (Winiacki) contacted ODA and confirmed The Lost Valley Dairy has been closed, and cleanup actions were taken to clean up wastes associated with mismanagement of the dairy and numerous violations documented during its operation.

Ex. 5 Deliberative Process (DP)

Ex. 5 Deliberative Process (DP)

Public Water Systems

Concern: At least 10 public water systems (both community and non-community) have had substantial nitrate problems or are at risk, serving a population of over 25,000 people inside the GWMA. Petitioner argues that continued failure of local authorities to abate nitrate contamination will continue to put these public water systems and the population they serve at risk.

Assessment: Region 10 (Baron) reviewed current data for impacted PWSs listed in the petition (reference email from Baron 01/29/2020, Public well info on Umatilla 1431 Petition) and followed up with OHA by phone during a standard ETT quarterly review meeting. His assessment is that OHA and PWS owner/operators appear to have taken or be taking timely actions to respond to nitrate MCL exceedances at affected PWS. In a phone call with Dave Emme of OHA, he confirmed that 12 public water systems within the GWMA have had to take measures to

respond to nitrate contamination, including drilling new and/or deeper wells or by adding nitrate treatment technology.

Private Wells

Concern: The petitioners expressed concern about the duration and extent of known nitrates in ground water exceeding the drinking water standard of 10 ppm, including data from the LUBGWMA confirming increasing trends over time, and significant percentages of monitoring wells and domestic wells exceeding the MCL for nitrates. Concern was also expressed for risk to individuals relying on domestic wells, citing data of birth rates as evidence of the potential for infants or nursing mothers who would be most at risk to be present and exposed without adequate protections.

Assessment: Based on data from 4 synoptic sampling events in 1992, 2003, 2009, and 2015, **many** wells have (or had) high nitrates exceeding the MCL, and anecdotal information of installation of treatment systems exists, however, there is not a database or other effort to assess the universe of domestic well owners and track by location, percentage, etc. the number of wells that currently exceed the MCL and that currently have treatment in place. Such a database or summary would improve the ability to target additional public health protections (notice, domestic well sampling, treatment and/or alternative water) to areas needing attention. Highlights from the Initial analysis of LUBGWMA on private wells include:

- ☐ private wells identified as exceeding nitrate MCL estimated at ☐ (if of all private wells in the area would equal approximately ☐). See pp.73 of LUBGWMA Second Local Action Plan (2019), **but information is unclear as to which wells currently exceed the MCL and are without treatment**
- 2019 2nd Action Report identifies actions under “Goal 4: Reduce the potential for contamination of wells and conduct analytical testing for nitrates in domestic wells and educational outreach to domestic well owners on point-of-use treatment options” proposed in 2020 by Umatilla and Morrow Counties for additional outreach to private well owners (see pp. 61, LUBGWMA Second Local Action Plan
- 4 synoptic events (**most recent in 2015/6**) covering 255 wells (including 56 private wells from Real Estate Transaction database) show 48% of wells in LUBGWMA exceed nitrate MCL.
- Data from ☐ wells from OHA indicating that ☐ of wells exceeding MCL at some point based on required testing during real estate transactions in the past 10 years. **A sample tested at ☐ as recently as 2017.**

Ex. 5 DP / Ex. 7(A)

- Petitioner’s Appendix E includes an article from 1996 a summarizing study of demographics and health risks from nitrates for rural northeastern Oregon based on a phone survey of private well owners. The survey included 83 households total and 25 of those households had installed treatment devices. While the survey did not identify infants or nursing mothers exposed to well water exceeding the MCL for nitrate at that time, it also highlighted the need for, and issues associated with, maintaining home treatment units and the importance of educational programs. A recent EJ Screen query of the area indicates that portions of the GWMA demographics contain a

higher proportion of the population under age 5 and “linguistically isolated” compared to national averages.

Initial questions posed by R10 WD & ECAD to guide initial staff review of petitioners’ information (and preliminary responses as of 02/27/2020 briefing):

TASK 1: Review of the Petition and Appendices: The group shall make specific team assignments to assess and answer these overarching questions:

- (1) Is the data on which the claims are based verifiable, has the data been presented accurately in the petition, and does the data available from State agencies confirm the representations made in the petition?

Yes, the data is verifiable and is primarily taken from the LUBGWMA reports. Region 10’s initial review of the data differs in some respects from the petitioner’s presentation. For example, a review of the PWS data in the petition does not clearly distinguish the most recent data, which would represent current exposure and human health risks.

- (2) Is the petition package so compelling and so well substantiated that EPA should issue an immediate 1431 order?

Ex. 5 DP / Ex. 7(A)

- (3) If question 2 is “no”, is the substantiation behind the claims of imminent and substantial endangerment of drinking water substantial enough to warrant further inquiry with State agencies?

Ex. 5 DP / Ex. 7(A)

- (4) Does the petition package result in a substantial question about the adequacy of the State’s actions to date, thereby warranting further inquiry with the State agencies?

Same as 3 above.

- (5) Does the petition package result in a substantial question about the effectiveness of the LUB GWMA and more specifically, the effectiveness of voluntary approaches?

Same as 3 above.

Attachment C

**Advisory Briefing for the Office of Water Leadership
(Prepared: May 20, 2020)**

Topic:

“Petition for Emergency Action Pursuant to the Safe Drinking Water Act § 1431, 42 U.S.C. § 300i, to Protect Citizens of the Lower Umatilla Basin in Oregon from Imminent and Substantial Endangerment to Public Health Caused by Nitrate Contamination of Public Water Systems and Underground Sources of Drinking Water,” dated January 16, 2020.

Background:

Nine entities jointly petitioned the EPA to exercise emergency powers established in Section 1431 of the Safe Drinking Water Act “to address groundwater contamination that has presented, and continues to present at ever-increasing levels, an imminent and substantial endangerment to the health of the residents of the Lower Umatilla Basin (‘LUB’) in Oregon.” The petition is substantiated with over 1,500 pages of appendix material, primarily consisting of publicly available reference documents and reports related to the Lower Umatilla Basin Groundwater Management Area (LUBGWMA).

The petitioners ask EPA to:

- provide alternative drinking water to the residents of the Umatilla and Morrow Counties;
- conduct further monitoring of water quality and to investigate sources of nitrate-nitrogen;
- issue orders requiring CAFOs and irrigated agriculture to modify their practices;
- issue an order prohibiting any CAFO operation on the former site of Lost Valley Farm;
- investigate Oregon’s BMPs for CAFO nutrient management to determine why they have been unsuccessful at protecting groundwater in the LUBGWMA;
- determine what enforcement measures should be implemented to effectively reduce nitrogen pollution from CAFO and agricultural sources and initiate those enforcement actions.

The EPA Region 10 Administrator provided an initial written response on January 29, 2020, which acknowledged receipt and indicated that EPA was reviewing the petition. The EPA Region 10 managers and staff from Enforcement and Compliance Assurance Division (ECAD), Water Division (WD), and the agriculture sector leads jointly reviewed the petition and conducted follow-up discussions with the State. Additionally, the efforts were supported by the Oregon Operations Office (OOO), the Office of Regional Counsel (ORC), and Office of Enforcement and Compliance Assurance (OECA).

EPA R10 met jointly with Oregon Health Authority (OHA), Oregon Department of Environmental Quality (ODEQ) and Oregon Department of Agriculture (ODA) on March 18, 2020, and then met individually through teleconference with the agencies on April 14 and 15, 2020. The attached letter is anticipated by the agencies.

Authority:

Under 1431, EPA has the authority to act on imminent and substantial endangerment of drinking water, including Underground Sources of Drinking Water (USDW) and public water systems. There is no legal procedural requirement or timeline to provide a written response to the petition under the Safe Drinking Water Act (SDWA). However, ORC and OECA has counseled

Ex. 5 AC / DP / Ex. 7(A)

Ex. 5 AC / DP / Ex. 7(A)

Ex. 5 AC / DP / Ex. 7(A)

9

Advisory Briefing for the Office of Water Leadership
(Prepared: May 20, 2020)

Discussion:

Public Water Systems (regulated by Oregon Health Authority as the SDWA primacy agency) are not a major concern, as the State seems to be appropriately addressing the nitrate-affected public water systems through the compliance and enforcement tools available to them. The primary concern that has emerged is the impact of nitrate on USDW used by individual (private) well owners. From the publicly available reports and information provided by the State Agencies, the following information provides a summary of what is known about individual (private) domestic drinking water wells:

- The LUBGWMA Second Local Action Plan (2019) indicates 72 private wells with nitrates over the national primary drinking water standard. This report estimates that “30 – 40%” are contaminated.
- Four synoptic events covering 255 wells (including 56 private wells from the State’s Real Estate Transaction database) show 48% of wells in LUBGWMA exceed the nitrate standard.
- According to OHA data collected through the real estate transaction database, 10 of 55 wells tested through real estate transactions have exceeded the nitrate primary drinking water standard at some point in the past 10 years.

The actions requested by the petitioner that are broadly directed at the agricultural and CAFO activities, are long-term efforts aimed at long-term (i.e. lagging) results. The State

Ex. 5 AC / DP / Ex. 7(A)

Ex. 5 AC / DP / Ex. 7(A)

However, based on the petition, the publicly available information and the information exchanges with Oregon Health Authority, Oregon Department of Agriculture and Oregon Department of Environmental Quality, the evidence suggests that

Ex. 5 AC / Ex. 7(A)

Ex. 5 AC / Ex. 7(A)

There is a gap in the understanding of the extent to which individual wells are contaminated in this zone of known contamination. The State is unable to provide a count of the number of private wells in use for domestic water supply, and does not know the number or percentage of the domestic wells contaminated with nitrates over 10 mg/L.

Ex. 5 DP / Ex. 7(A)

Ex. 5 DP / Ex. 7(A)

OGC’s Recommended Addition (Incorporated into the Letter):

Upon review of the draft letter from Region 10 to the State, Office of General Counsel recommended the following additional language: “This letter does not require the State to collect additional data or information. Rather, EPA requests that the State confirm the correctness of the information EPA has received in Food and Water Watch’s January 2020 letter seeking EPA action under SDWA section 1431 and to provide information about any actions which the State is taking or will take. If the State chooses to provide additional data or information voluntarily to address the data gaps identified in this letter, such data and information would be helpful to EPA in determining whether to take action necessary to protect the health of persons under SDWA section 1431.”

Proposed Action:

EPA Region 10 proposes to send the attached draft letter under the signature of the Acting Director, Enforcement and Compliance Assurance Division (ECAD).

Reference: 20-C04

RE: January 16, 2020, Petition to EPA for Emergency Action Pursuant to Safe Drinking Water Act
Section 1431 to Address Nitrate in LUB GWMA in North Central Oregon

Dear Mr. Davies:

This letter is in follow up to a communication from the State of Oregon on July 2, 2020, regarding the Lower Umatilla Basin Groundwater Manager Area ("LUBGWMA"). Below we provide an update on the Oregon Health Authority's (OHA's) ability to remain engaged in this work.

We regret to share with you that after September 30, 2020, the Domestic Well Safety Program (DWSP) at OHA will go dormant until we secure further funding. This letter provides details of what this means for the program, our partnerships, Domestic Well Testing Act (DWTA, [ORS 448.271](#)) data, water insecurity work and future possibilities.

In June 2020, OHA applied for renewed federal funding of our DWSP, which grant funding from the Centers for Disease Control and Prevention (CDC) had supported for seven years in advance of the September 30, 2020 end date of the current grant. On September 3, 2020, CDC indicated OHA would not receive funding for the upcoming grant cycle. Although there are no guarantees that future federal or state funds will become available, the earliest opportunity OHA could secure such funding will be summer or fall 2021. The 2021 state legislative session may provide an opportunity to fund the program starting next summer through general state funds. Otherwise, we will continue to apply for CDC funding opportunities as they become available. We plan to keep aware for other funding opportunities as they arise and intend to pursue any opportunities that cross our path.

We intend to leave the DWSP organized and ready for the next funding opportunity. Fortunately, our partnership with Oregon State University and the Be Well! study will provide 0.1 FTE to dedicate to DWSP. With this time, we will participate in the study, help develop study-related outreach materials and continue answering the phones and responding to emails. We will continue to collect DWTA data in physical and electronic folders until we secure further funding. Regarding DWTA data, we will be able to provide existing data on request, but will not be entering new data to the OHA database, nor providing residents with individual outreach based on DWTA data showing poor water quality or conducting new statewide domestic groundwater hazard analyses. We will also no longer participate in

outreach and education efforts in support of our partners including realtors, private well professionals, laboratories and natural resource partners.

While we are obligated to suspend the data, outreach and engagement functions of the DWSP, we are carrying out related actions to address environmental health risks related to water. Over the past two years, we began developing the evidence base to support policies to ensure people in Oregon have adequate and equitable access to clean, safe and affordable water for drinking, cooking, sanitation and hygiene so as to avoid the effects of water insecurity. We [published a systematic literature review](#) that is already informing statewide water planning efforts including Oregon's 100-Year Water Vision. In coordination with our Environmental Public Health Tracking program, we are already taking steps to quantify the issue of water insecurity in Oregon. We are hopeful that future funding of DWSP will help us draw attention to some of the issues faced by Oregon's private domestic well users. Please feel free to contact me at Gabriela.G.Goldfarb@state.or.us or 971-673-3284 or Curtis Cude, Surveillance Unit Manager at Curtis.G.Cude@state.or.us or 971-673-0975.

Sincerely,

A handwritten signature in blue ink that reads "Gabriela Goldfarb". The signature is fluid and cursive, with the first name and last name clearly legible.

Gabriela Goldfarb
